Generation and Transmission Planning

Overview

Planned Generation and Retirements

- Planned Generation. At December 31, 2012, 76,387 MW of capacity were in generation request queues for construction through 2018, compared to an average installed capacity of 185,000 MW in 2012 including the January 1, 2012, DEOK integration. Wind projects account for approximately 21,359 MW of nameplate capacity, 28.0 percent of the MW in the queues, and combined-cycle projects account for 42,724 MW, 55.8 percent of the MW in the queues.
- Generation Retirements. A total of 7,130.9 MW of generation capacity retired from January 1, 2012 through January 1, 2013, and it is expected that a total of 21,524.9 MW will have retired from 2011 through 2019, with most of this capacity retiring by the end of 2015. Retirements from January 1, 2011 through January 1, 2013, account for 8,453.2 MW. Units planning to retire in 2013 account for 237.4 MW, or 1.1 percent of planned retirements during this period. Overall, 3,951.1 MW, or 18.4 percent of all retirements from 2011 through 2019, are expected in the AEP zone.
- Generation Mix. A potentially significant change in the distribution of unit types within the PJM footprint is likely as a combined result of the location of generation resources in the queue and the location of units likely to retire. In both the EMAAC and SWMAAC LDAs, the capacity mix is likely to shift to more natural gas-fired combined cycle (CC) and combustion turbine (CT) capacity. Elsewhere in the PJM footprint, continued reliance on steam (mainly coal) seems likely, despite retirements of coal units.

Generation and Transmission Interconnection Planning Process

• Any entity that requests interconnection of a generating facility, including increases to the capacity of an existing generating unit, or that requests interconnection of a merchant transmission facility, must follow the process defined in the PJM

tariff to obtain interconnection service.¹ The process is complex and time consuming as a result of the nature of the required analyses. The cost, time and uncertainty associated with interconnecting to the grid may create barriers to entry for potential entrants.

• The queue contains a substantial number of projects that are not likely to be built, including 7,584.2 MW that should already be in service based on the original queue date, but that is not yet even under construction. These projects may also create barriers to entry for projects that would otherwise be completed by taking up queue positions, increasing interconnection costs and creating uncertainty.

Key Backbone Facilities

 PJM baseline transmission projects are implemented to resolve reliability criteria violations. PJM backbone transmission projects are a subset of significant baseline projects. The backbone projects are intended to resolve a wide range of reliability criteria violations and congestion issues and have substantial impacts on energy and capacity markets. The current backbone projects are: Mount Storm – Doubs; Jacks Mountain; and Susquehanna – Roseland. The total planned costs for all of these projects are approximately 1.7 billion dollars.

Economic Planning Process

• Transmission and Markets. As a general matter, transmission investments have not been fully incorporated into competitive markets. The construction of new transmission facilities can have significant impacts on energy and capacity markets, but there is no market mechanism in place that would require direct competition between transmission and generation to meet loads in an area. PJM has taken a first step towards integrating transmission investments into the market through the use of economic evaluation metrics.² The goal of transmission investment decisions into market driven processes as much as possible.

¹ OATT Parts IV & VI.

² See 126 FERC ¶ 61,152 (2009) (final approval for an approach with predefined formulas for determining whether a transmission investment passes the cost-benefit test including explicit accounting for changes in production costs, the costs of complying with environmental regulations, generation availability trends and demand-response trends), order on reh'g, 123 FERC ¶ 61,051 (2008).

• **Competitive Grid Development.** In Order No. 1000, the FERC requires that each public utility transmission provider (including PJM) remove from its FERC approved tariff and agreements, as necessary and subject to certain limitations, a federal right of first refusal (ROFR) for certain new transmission projects.^{3,4} A key limitation is the ability to retain ROFR for upgrades to the existing transmission infrastructure.

Conclusion

The goal of PJM market design should be to enhance competition and to ensure that competition is the driver for all the key elements of PJM markets. But transmission investments have not been fully incorporated into competitive markets. The construction of new transmission facilities has significant impacts on energy and capacity markets. But when generating units retire, there is no market mechanism in place that would require direct competition between transmission and generation to meet loads in that area. In addition, despite Order 1000, there is not yet a robust mechanism to permit competition between transmission developers to build transmission projects. The addition of a planned transmission project changes the parameters of the capacity auction for the area, changes the amount of capacity needed in the area, changes the capacity market supply and demand fundamentals in the area and effectively forestalls the ability of generation to compete. There is no mechanism to permit a direct comparison, let alone competition, between transmission and generation alternatives. There is no evaluation of whether the generation or transmission alternative is less costly or who bears the risks associated with each alternative. Creating such a mechanism should be a goal of PJM market design.

Planned Generation and Retirements Planned Generation Additions

Net revenues provide incentives to build new generation to serve PJM markets. While these incentives operate with a significant lag time and are based on expectations of future net revenue, the amount of planned new generation in PJM reflects investors' perception of the incentives provided by the combination of revenues from the PJM Energy, Capacity and Ancillary Service Markets. At December 31, 2012, 76,387 MW of capacity were in generation request queues for construction through 2018, compared to an average installed capacity of 185,000 MW in 2012 including the January 1, 2012, DEOK integration. Although it is clear that not all generation in the queues will be built, PJM has added capacity annually since 2000 (Table 11-1).⁵ Overall, 2,669 MW of nameplate capacity were added in PJM in 2012 (excluding the integration of the DEOK zone).

PJM Generation Queues

Generation request queues are groups of proposed projects. Queue A was open from February 1997 through January 1998; Queue B was open from February 1998 through January 1999; Queue C was open from February 1999 through July 1999 and Queue D opened in August 1999. After Queue D, a new queue was opened every six months until Queue T, when new queues began to open annually. Queue Y will be active through January 31, 2013.

Capacity in generation request queues for the seven year period beginning in 2012 and ending in 2018 decreased by 14,338 MW from 90,725 MW in 2011 to 76,387 MW in 2012, or 15.8 percent (Table 11-2).⁷ Queued capacity scheduled for service in 2012 decreased from 27,184 MW to 12,301 MW, or 54.7 percent, though only 2,669 MW

³ Transmission Planning and Cost Allocation by Transmission Owning and Operating Public

Utilities, Order No. 1000, FERC Stats. & Regs. ¶31,323 (2011)

⁴ *Id.* at PP 313–322.

⁵ The capacity additions are new MW by year, including full nameplate capacity of solar and wind facilities and are not net of retirements or deratings.

⁶ The capacity described in this table refers to all installed capacity in PJM, regardless of whether the capacity entered the RPM auction.

⁷ See the 2011 State of the Market Report for PJM: Volume II, Section 11, pp. 286-288, for the queues in 2011.

went into service in 2012. Queued capacity scheduled for service in 2013 decreased from 13,051 MW to 9,819 MW, or 24.8 percent. The 76,387 MW include generation with scheduled in-service dates in 2012 and units still active in the queue with in-service dates scheduled before 2012, listed at nameplate capacity, although these units are not yet in service.

Table 11-2 Queue comparison (MW): December 31, 2012 vs. December 31, 2011

| | MW in the | MW in the | Year-to-Year | Year-to-Year |
|-------|------------|------------|--------------|--------------|
| | Queue 2011 | Queue 2012 | Change (MW) | Change |
| 2012 | 27,184 | 12,301 | (14,883) | (54.7%) |
| 2013 | 13,051 | 9,819 | (3,232) | (24.8%) |
| 2014 | 17,036 | 8,086 | (8,950) | (52.5%) |
| 2015 | 19,251 | 22,295 | 3,044 | 15.8% |
| 2016 | 9,288 | 11,788 | 2,500 | 26.9% |
| 2017 | 1,720 | 8,932 | 7,212 | 419.3% |
| 2018 | 3,194 | 3,165 | (29) | (0.9%) |
| Total | 90,725 | 76,387 | (14,338) | (15.8%) |

Table 11-3 shows the amount of capacity active, inservice, under construction or withdrawn for each queue since the beginning of the Regional Transmission Expansion Plan (RTEP) Process and the total amount of capacity that had been included in each queue.⁸

Data presented in Table 11-4 show that through 2012, 37.7 percent of total in-service capacity from all the queues was from Queues A and B and an additional 6.4

⁸ Projects listed as active have been entered in the queue and the next phase can be under construction, in-service or withdrawn. At any time, the total number of projects in the queues is the sum of active projects and under-construction projects.

⁹ The 2012 State of the Market Report for PJM contains all projects in the queue including reratings of existing generating units and energy only resources.

¹⁰ Projects listed as partially in-service are counted as in-service for the purposes of this analysis.

percent was from Queues C, D and E.¹¹ As of December 31, 2012, 31.8 percent of the capacity in Queues A and B has been placed in service, and 9.7 percent of all queued capacity has been placed in service.

The data presented in Table 11-4 show that for successful projects there is an average time of 831 days between entering a queue and the in-service date, an increase of 29 days since 2011. The data also show that for withdrawn projects, there is an average time of 543 days between entering a queue and completion or exiting. For each status, there is substantial variability around the average results.

Table 11-4 Average project queue times (days): At December 31, 2012

| Status | Average (Days) | Standard Deviation | Minimum | Maximum |
|--------------|-------------------|-----------------------|---------|---------|
| Active | 882 | 634 | 0 | 2,801 |
| In-Service | 831 | 710 | 0 | 3,964 |
| Suspended | 2,155 | 922 | 704 | 3,849 |
| Under | | | | |
| Construction | 1,412 | 785 | 0 | 5,083 |
| Withdrawn | 543 | 556 | 0 | 3,186 |

Table 11-5 shows active queued capacity that was planned to be in service by January 1, 2013. This indicates there is a substantial amount of queued capacity, 7,584.2 MW, that should already be in service based on the original queue date but that is not yet even under construction. The MMU recommends that a review process be created to ensure that projects are removed from the queue, if they are no longer viable and no longer planning to complete the project.

Table 11–5 Active capacity queued to be in service prior to January 1, 2013

| | MW |
|-------|---------|
| 2007 | 87.0 |
| 2008 | 347.0 |
| 2009 | 296.4 |
| 2010 | 2,160.5 |
| 2011 | 3,639.2 |
| 2012 | 1,054.1 |
| Total | 7,584.2 |
| | |

Distribution of Units in the Queues

A more detailed examination of the queue data permits some additional conclusions. The geographic

distribution of generation in the queues shows that new capacity is being added disproportionately in the west, and includes a substantial amount of wind capacity. At December 31, 2012, 76,387 MW of capacity were in generation request queues for construction through 2018, compared to an average installed capacity of 185,000 MW in 2012 including the January 1, 2012, DEOK integration. Wind projects account for 21,359 MW of nameplate capacity or 28.0 percent of the capacity in the queues and combined-cycle projects account for 42,724 MW of capacity or 55.9 percent of the capacity in the queues.¹² On December 31, 2012, there were 42,724 MW of capacity from combined cycle units in the queue, compared to 34,788 MW in 2011, an increase of 22.8 percent. At December 31, 2012, there was queued combined cycle capacity in nearly every zone in PJM, and after accounting for the derating of wind and solar resources, combined cycle capacity comprises 75.9 percent of the MW in the queue able to offer into RPM auctions.

Table 11-6 shows the projects under construction or active as of December 31, 2012, by unit type and control zone. Most of the steam projects (99.4 percent of the MW) and most of the wind projects (93.8 percent of the MW) are outside the Eastern MAAC (EMAAC)¹³ and Southwestern MAAC (SWMAAC)¹⁴ locational deliverability areas (LDAs).¹⁵ Of the total capacity additions, only 15,323 MW, or 20.1 percent, are projected to be in EMAAC, while 4,225 MW or 5.5 percent are projected to be constructed in SWMAAC. Of total capacity additions, 29,272 MW, or 38.3 percent of capacity, is being added inside MAAC zones. Overall, 74.4 percent of capacity is being added outside EMAAC and SWMAAC, and 61.6 percent of capacity is being added outside MAAC zones, not accounting for the planned integration of the EKPC zone in 2013. Wind projects account for 2,933 MW of capacity in MAAC LDAs, or 10.0 percent. While there are no wind projects in the SWMAAC LDA, in the EMAAC LDA wind projects account for 1,319 MW of capacity, or 8.6 percent.

¹¹ The data for Queue Y include projects through September 30, 2012.

¹² Since wind resources cannot be dispatched on demand, PJM rules previously required that the unforced capacity of wind resources be derated to 20 percent of installed capacity until actual generation data are available. Beginning with Queue U, PJM derates wind resources to 13 percent of installed capacity. PJM derates solar resources to 38 percent of installed capacity. Based on the derating of 21,359 MW of wind resources and 2,447 MW of solar resources, the 76,387 MW currently active in the queue would be reduced to 56,288 MW.

¹³ EMAAC consists of the AECO, DPL, JCPL, PECO and PSEG Control Zones.

¹⁴ SWMAAC consists of the BGE and Pepco Control Zones.

¹⁵ See the 2012 State of the Market Report for PJM, Volume II, Appendix A, "PJM Geography" for a map of PJM LDAs.

There are potentially significant implications for future congestion, the role of firm and interruptible gas supply and natural gas supply infrastructure, if older steam units are replaced by units burning natural gas. (Table 11-7)

Table 11-8 shows existing generation by unit type and control zone. Existing steam (mainly coal and residual oil) and nuclear capacity is distributed across control zones.

A potentially significant change in the distribution of unit types within the PJM footprint is likely as a combined result of the location of generation resources in the queue (Table 11-6) and the location of units likely to retire. In both the EMAAC and SWMAAC LDAs, the capacity mix is likely to shift to more natural gasfired combined cycle (CC) and combustion turbine (CT) capacity. The western part of the PJM footprint is also likely to see a shift to more natural gas-fired capacity due to changes in environmental regulations and natural gas costs, but likely will maintain a larger amount of coal steam capacity than eastern zones.

¹⁶ WMAAC consists of the Met-Ed, PENELEC, and PPL Control Zones.

Table 11-10 shows the effect that the new generation in the queues would have on the existing generation mix, assuming that all non-hydroelectric generators in excess of 40 years of age retire by 2018. The expected role of gas-fired generation depends largely on projects in the queues and continued retirement of coal-fired generation. New gas-fired capability would represent 88.7 percent of all new capacity in EMAAC when the derating of wind and solar capacity is reflected.

In 2012, a planned addition of 1,640 MW of nuclear capacity to Calvert Cliffs in SWMAAC was withdrawn from the queue. Without the planned nuclear capability

in SWMAAC, new gas-fired capability represents 98.9 percent of all new capability in the SWMAAC. In 2018, this would mean that CC and CT generators would comprise 55.0 percent of total capability in SWMAAC.

In Non-MAAC zones, if older units retire, a substantial amount of coal-fired generation would be replaced by wind generation if the units in the generation queues are constructed.¹⁸ In these zones, 87.8 percent of all generation 40 years or older is steam (primarily coal). With the retirement of these units in 2018, wind farms would comprise 16.8 percent of total MW ICAP in Non-MAAC zones, if all queued MW are built.

¹⁷ The capacity described in this section refers to all installed capacity in PJM, regardless of whether the capacity entered the RPM auction.

¹⁸ Non-MAAC zones consist of the AEP, AP, ATSI, ComEd, DAY, DEOK, DLCO, and Dominion Control Zones.

Table 11-10 Comparison of generators 40 years and older with slated capacity additions (MW): Through 2018¹⁹

19 Percentages shown in Table 11-10 are based on unrounded, underlying data and may differ from calculations based on the rounded values in the tables.

Planned Deactivations

As shown in Table 11-11, 21,524.9 MW are planning to deactivate by the end of calendar year 2019. A total of 7,130.9 MW of generation capacity retired from January 1, 2012 through January 1, 2013, and it is expected that a total of 21,524.9 MW will have retired from 2011 through 2019, with most of this capacity retiring by the end of 2015. Retirements from January 1, 2011 through January 1, 2013, account for 8,453.2 MW, or 39.3 percent of retirements during this period. Units planning to retire in 2013 account for 237.4 MW, or 1.1 percent of retirements during this period. Overall, 3,951.1 MW, or 18.4 percent of all retirements from 2011 through 2019, are expected in the AEP zone.

Actual Generation Deactivations in 2012

Table 11-14 shows unit deactivations for 2012 through January 1, 2013.²¹ A total of 7,130.9 MW retired from January 1, 2012, through January 1, 2013, including 2,320 MW from FirstEnergy Corp, or 32.5 percent of these retirements. The retirements included 5,813.9 MW of coal steam generation, 788.0 MW of light oil generation, 250.0 MW of natural gas generation, 166.0 MW of heavy oil generation, 16.0 MW of wood waste generation and 3.0 MW of diesel generation. Of these retirements, 1,458.0 MW, or 20.4 percent, were in the ATSI zone

Updates on Key Backbone Facilities

PJM baseline upgrade projects are implemented to resolve reliability criteria violations. PJM backbone projects are a subset of baseline upgrade projects that have been given the informal designation of backbone due to their relative significance. Backbone upgrades are on the EHV (Extra High Voltage) system and resolve a wide range of reliability criteria violations and market congestion issues. The current backbone projects are: Mount Storm – Doubs; Jacks Mountain; and Susquehanna – Roseland.

On May 17, 2012, the PJM Board of Managers approved approximately \$2 billion in transmission facilities upgrades, including more than 130 separate transmission upgrades.²² The upgrades include upgrading existing transmission lines, constructing new transmission lines, installing new transformers, installing new substations, and adding capacitors and SVCs.

Transmission projects above \$5 million are shown in Table 11-15, Table 11-16 and Table 11-17 for the Eastern, Western and Southern regions of PJM.

| Table 11-15 Ma | jor upgrade | projects in | Eastern Region |
|----------------|-------------|-------------|----------------|
| | | | |

| Zone | Upgrade Description | Cost (Millions) |
|---------|---|-----------------|
| | Construct a new Whippany to Montville 230 kV | |
| JCPL | line | \$37.5 |
| | Convert the Lewis Run Farmers Valley 115 kV line | |
| PENELEC | to 230 kV | \$46.8 |
| | Construct Farmers Valley 345/230 kV and 230/115 | |
| | kV substation by looping the Homer City to Stolle | |
| PENELEC | Road 345 kV line into Farmers Valley | \$29.5 |
| PENELEC | Relocate the Erie South 345 kV line bay | \$13.0 |
| | Construct a 115 kV ring bus at Claysburg | |
| PENELEC | Substation | \$5.3 |
| | Reconductor 230 kV line 23032 and 23034 with | |
| Pepco | high temperature conductor | \$16.0 |
| | Install a new North Lancaster 500/230 kV | |
| PPL | substation | \$42.0 |

Table 11-16 Major upgrade projects in Western Region

| Zone | Upgrade Description | Cost (Millions) |
|------|--|----------------------|
| | Install a new 765/345 substation at Mountaineer | |
| AEP | and build a 3/4 mile 345 kV line to Sporn | \$65.0 |
| AEP | Add four 765 kV breakers at Kammer | \$30.0 |
| AEP | Reconductor Kammer West Bellaire 345 kV | \$20.0 |
| | Terminate Transformer #2 at SW Lima in a new bay | |
| AEP | position | \$5.0 |
| | Loop the Homer City-Handsome Lake 345 kV line | |
| | into the Armstrong substation and install a 345/138 | |
| APS | kV transformer at Armstrong | \$27.8 |
| APS | Install a new Buckhannon Weston 138 kV line | \$17.5 |
| | Convert Moshannon substation to a four breaker | |
| APS | 230 kV ring | \$6.5 |
| ATSI | Build a new Toronto to Harmon 345 kV line | \$218.3 |
| ATSI | Build a new Mansfield - Northfield Area 345 kV line | \$184.5 |
| | Convert Eastlake units 1, 2, 3, 4 and 5 to | |
| ATSI | synchronous condensers | \$100.0 |
| ATSI | Build new Allen Jct - Midway - Lemoyne 345kV line | \$86.3 |
| | Create a new Harmon 345/138/69 kV substation by | |
| ATSI | looping in the Star South Canton 345 kV line | \$46.0 |
| | Build a new Leroy Center 345/138 kV substation by | |
| ATSI | looping in the Perry Harding 345 kV line | \$46.0 |
| ATSI | Build a new West Fremont Groton Hayes 138 kV line | \$45.0 |
| ATSI | Build a new Toronto 345/138 kV substation | \$41.8 |
| | Create a new Northfield Area 345 kV switching | |
| | station by looping in the Eastlake Juniper 345 kV | |
| ATSI | line and the Perry - Inland 345 kV line | \$37.5 |
| ATSI | Build a new 345-138kV Substation at Niles | \$32.0 |
| | Add a new 150 MVAR SVC and 100 MVAR capacitor | |
| ATSI | at New Castle | \$31.7 |
| | Create a new Five Points Area 345/138 kV | |
| | substation by looping in the Lemoyne Midway 345 | |
| ATSI | kV line | \$30.0 |
| ATSI | Convert Lakeshore 18 to synchronous condensers | \$20.0 |
| | Build a new substation near the ATSI-AEP border | |
| ATCI | and a new 138kV line from new substation to | 6 4 77 |
| ATSI | Longview | \$17.7 |
| ATCI | Re-conductor the Galion GM Mansfield Ontario - | \$ 2.0 |
| ATSI | Cairns 138 kV line | \$9.8 |
| ATCI | Build a new Harmon Brookside + Harmon - | \$ 0.0 |
| ATSI | Longview 138 kV line | \$9.2 |
| ATCI | Install a 345/138 kV transformer at the Inland Q-11 station | ¢7.0 |
| ATSI | | \$7.2 |
| ΔΤΩΙ | Install a 2nd 345/138 kV transformer at the Allen | <u> </u> |
| ATSI | Junction station | \$7.2 |
| ATCI | Install a 2nd 345/138 kV transformer at the Bay | A-7 0 |
| ATSI | Shore station | \$7.2 |
| ATCI | Reconductor the ATSI portion of South Canton | * ~ ~ |
| ATSI | Harmon 345 kV line | \$6.0 |
| DLCO | Install a third 345/138 kV transformer at Collier | \$8.0 |

| Table 11-17 | Major | upgrade | projects i | n Southern | Region |
|-------------|-------|---------|------------|------------|--------|
| | | | | | |

| Zone | Upgrade Description | Cost (Millions) |
|----------|--|------------------|
| Dominion | Rebuild Lexington to Dooms 500 kV line | \$120.0 |
| Dominion | Build a 500 MVAR SVC at Landstown 230 kV | \$60.0 |
| Dominion | Build new Surry to Skiffes Creek 500 kV line | \$58.3 |
| Dominion | Build new Skiffes Creek Whealton 230 kV line | \$46.4 |
| | Expand Yadkin 500/230 kV and 230/115 kV | |
| Dominion | substation and Chesapeake 230/115 kV substation | \$45.0 |
| Dominion | Build new Skiffes Creek 500/230 substation | \$42.4 |
| Dominion | Build a new Suffolk to Yadkin 230 kV line | \$40.0 |
| Dominion | Add a third 500/230 kV transformer at Yadkin | \$16.0 |
| Dominion | Install a third 500/230 kV transformer at Clover | \$16.0 |
| Dominion | Install a second Valley 500/230 kV transformer | \$16.0 |
| Dominion | Upgrade Bremo Midlothian 230 kV line | \$10.0 |
| Dominion | Add six 500 kV breakers at Yadkin | \$8.0 |

In August, 2012, the PJM Board of Managers cancelled the Potomac-Appalachian Transmission Highline (PATH) and Mid-Atlantic Power Pathway (MAPP) projects based on recommendations from Transmission Expansion Advisory Committee (TEAC) that were based in part on reductions in load growth.²³

On October 1, 2012, the Susquehanna – Roseland project received final approval from the National Park Service (NPS) for the project to be constructed on the route selected by PSEG and PPL.²⁴

Transmission Planning Rules

In 2012, the Commission approved PJM proposed revisions to its planning process that removed some of its bright line aspects.²⁵ The Commission found that "the proposed revisions strike an appropriate balance between the need for PJM to maintain some flexibility given the scenario-based nature of the analysis in PJM's revised RTEP process and the need for sufficient detail in the tariff to allow stakeholders to participate in the planning process."²⁶ The Commission also found that the revisions "define a reasonable framework for its revised RTEP process while expanding the opportunities for stakeholder participation throughout its transmission planning process."²⁷ The Commission rejected arguments that rules lacked specific metrics and criteria for PJM to employ when evaluating the results of sensitivity studies

and scenario analyses.²⁸ The Commission indicated that it may reconsider some of these changes in its review of PJM's Order No. 1000 compliance filing, now pending in FERC Docket No. ER13-198.

Competitive Grid Development

In Order No. 1000, the FERC requires regional transmission planning processes to modify the criteria for an entity to "propose a transmission project for selection in the regional transmission plan for purposes of cost allocation, whether that entity is an incumbent transmission provider or a nonincumbent transmission developer."^{29,30} Such criteria "must not be unduly discriminatory or preferential."³¹

Order No. 1000 requires, among other things, that each public utility transmission provider (including PJM) remove from its FERC approved tariff and agreements, as necessary and subject to certain limitations, a federal right of first refusal (ROFR) for certain new transmission projects.³² ROFR would continue to apply to transmission projects not included in a regional transmission plan for purposes of cost allocation, and ROFR would continue apply to upgrades to transmission facilities.³³

Order No. 1000 allows, but does not require, competitive bidding to solicit transmission projects or developers.³⁴ The rule does not override or otherwise affect state or local laws concerning construction of transmission facilities, such as siting or permitting.³⁵

On October 25, 2012, PJM submitted a filing in compliance with Order No. 1000.³⁶ PJM adopted a sponsorship model and made some organizational changes to the process, including defining three categories of projects, Longlead projects, Short-term Projects and Immediate-need Reliability Projects, and applying different procedural rules to each.³⁷

The MMU filed a protest complaining that PJM's proposal continued to lack definition to key terms that

affect the evaluation of projects and did not allow for meaningful competition on project costs.³⁸ The MMU is concerned that the process continues to contain shortcomings evident in RTEP consideration of certain projects proposed by Primary Power, which lead to litigation. That litigation was resolved in an order on complaint that found that PJM has followed the current rules when awarding to incumbents certain projects contested by Primary Power.³⁹ The MMU filed comments in that proceeding, observing, "There does not appear to have been a process that would have permitted direct competition between Primary Power and the Incumbents."40 The MMU also pointed out that Primary Power's complaint demonstrated that the concepts of sponsorship, upgrades and new versus revised projects needed clarification.41 The Commission explained that it "stated in Order No. 1000 that the public utility transmission providers in a region may, but are not required to, use competitive solicitation to solicit project or project developers to meet regional needs."42

The MMU also recommended to the Commission that PJM include in its Order No. 1000 compliance filing provisions that would allow competition to finance projects, without regard to who proposes them, or who builds them or owns them.⁴³
