

PJM Geography

During 2013, the PJM geographic footprint encompassed 20 control zones located in Delaware, Illinois, Indiana, Kentucky, Maryland, Michigan, New Jersey, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, West Virginia and the District of Columbia.

Figure A-1 PJM's footprint and its 20 control zones

Legend

Allegheeny Power Company (AP)	Duquesne Light (DLCO)
American Electric Power Co., Inc (AEP)	Eastern Kentucky Power Cooperative (EKPC)
American Transmission Systems, Inc. (ATSI)	Jersey Central Power and Light Company (JCPL)
Atlantic Electric Company (AECO)	Metropolitan Edison Company (Met-Ed)
Baltimore Gas and Electric Company (BGE)	PECO Energy (PECO)
ComEd	Pennsylvania Electric Company (PENELEC)
Dayton Power and Light Company (DAY)	Pepco
Delmarva Power and Light (DPL)	PPL Electric Utilities (PPL)
Dominion	Public Service Electric and Gas Company (PSEG)
Duke Energy Ohio/Kentucky (DEOK)	Rockland Electric Company (RECO)

Analysis of 2013 market results requires comparison to 2012 and certain other prior years. In 2013, PJM integrated the Eastern Kentucky Power Cooperative (EKPC) Control Zone. In 2012, PJM integrated the Duke Energy Ohio and Kentucky (DEOK) Control Zone. In 2011, PJM integrated the ATSI Control Zone. In 2006 through 2010 the PJM footprint was stable. In 2004 and 2005, PJM integrated five new control zones, three in 2004 and two in 2005. When making comparisons involving this period, the 2004, 2005 and 2006 state of the market reports referenced phases, each corresponding to market integration dates:¹

- **Phase 1 (2004).** The four-month period from January 1, through April 30, 2004, during which PJM was comprised of the Mid-Atlantic Region, including its 11 zones,² and the Allegheny Power Company (AP) Control Zone.³
- **Phase 2 (2004).** The five-month period from May 1, through September 30, 2004, during which PJM was comprised of the Mid-Atlantic Region, including its 11 zones, the AP Control Zone and the ComEd Control Area.⁴
- **Phase 3 (2004).** The three-month period from October 1, through December 31, 2004, during which PJM was comprised of the Mid-Atlantic Region, including its 11 zones, the AP Control Zone and the ComEd Control Zone plus the American Electric Power Control Zone (AEP) and The Dayton Power & Light Company Control Zone (DAY). The ComEd Control Area became the ComEd Control Zone on October 1.
- **Phase 4 (2005).** The four-month period from January 1, through April 30, 2005, during which PJM was comprised of the Mid-Atlantic Region, including its 11 zones, the AP Control Zone, the ComEd Control Zone, the AEP Control Zone and the DAY Control Zone plus the Duquesne Light Company (DLCO) Control Zone which was integrated into PJM on January 1, 2005.
- **Phase 5 (2005 through 2011).** The period from May 1, 2005, through May 31, 2011, during which PJM was comprised of the Phase 4 elements plus the Dominion Control Zone which was integrated into PJM on May 1, 2005.
- **Phase 6 (2011).** The period from June 1, through December 31, 2011, during which PJM was comprised of the Phase 5 elements plus the ATSI Control Zone which was integrated into PJM on June 1, 2011.
- **Phase 7 (2012).** The period from January 1, 2012, through May 31, 2013, during which PJM was comprised of the Phase 6 elements plus the DEOK Control Zone which was integrated into PJM on January 1, 2012.
- **Phase 8 (2013).** The period from June 1, 2013, through the present, during which PJM was comprised of the Phase 7 elements plus the EKPC Control Zone which was integrated into PJM on June 1, 2013.

A locational deliverability area (LDA)⁵, defined as part of the RPM capacity market, is a Control Zone or part of a Control Zone within PJM with defined internal generation and defined transmission capability to import capacity in the RPM design.

¹ See the 2004 State of the Market Report (March 8, 2005) for more detailed descriptions of Phases 1, 2 and 3 and the 2005 State of the Market Report (March 8, 2006) for more detailed descriptions of Phases 4 and 5.

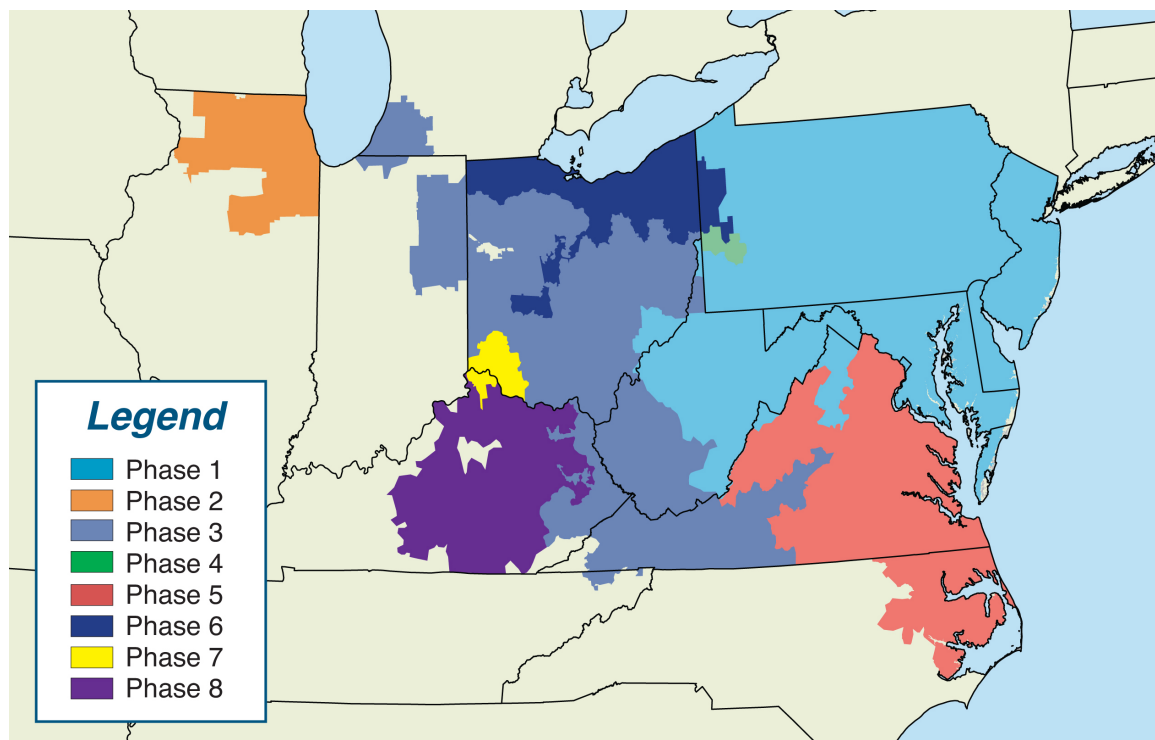

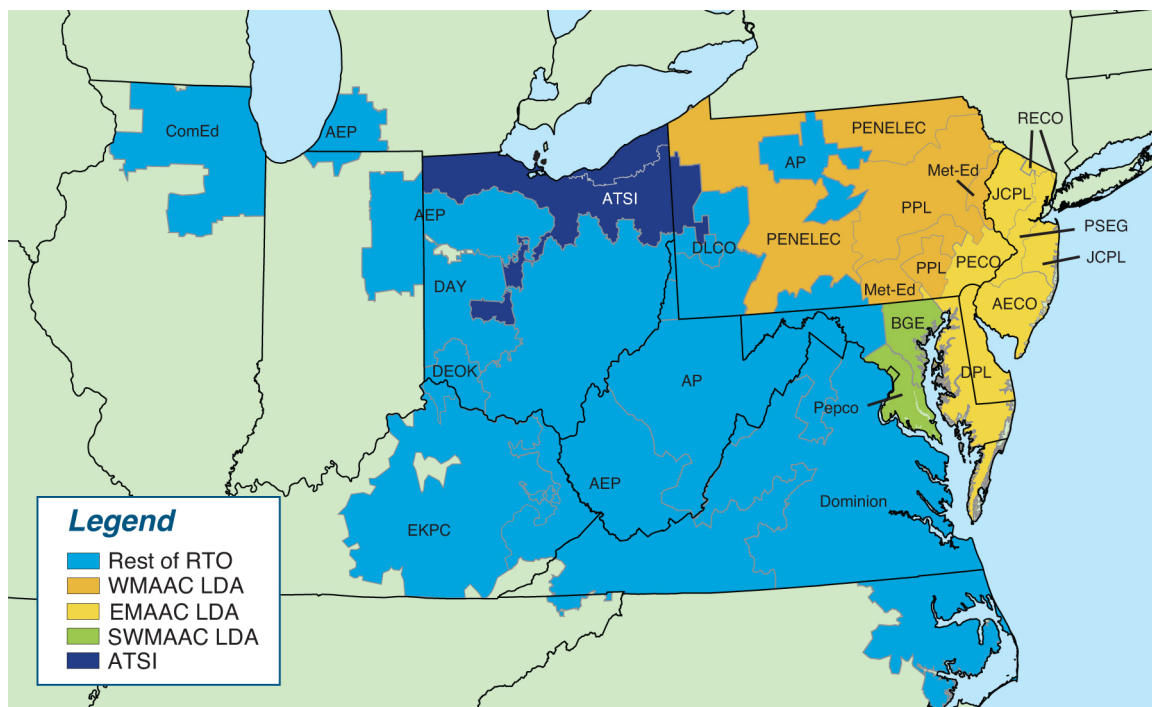

² The Mid-Atlantic Region is comprised of the AECO, BGE, DPL, JCPL, Met-Ed, PECO, PENELEC, Pepco, PPL, PSEG and RECO control zones.

³ Zones, control zones and control areas are geographic areas that customarily bear the name of a large utility service provider operating within their boundaries. Names apply to the geographic area, not to any single company. The geographic areas did not change with the formalization of these concepts during PJM integrations. For simplicity, zones are referred to as control zones for all phases. The only exception is ComEd which is called the ComEd Control Area for Phase 2 only.

⁴ During the five-month period May 1, through September 30, 2004, the ComEd Control Zone (ComEd) was called the Northern Illinois Control Area (NICA).

⁵ OATT Attachment DD § 2.38.

Figure A-2 PJM integration phases

Figure A-3 PJM locational deliverability areas⁶

⁶ The ATSI Control Zone integration into PJM was effective beginning with the 2011/2012 delivery year. The ATSI Control Zone is considered a non-MAAC LDA.

In PJM's Reliability Pricing Model (RPM) Auctions, an LDA becomes a separate market when it cannot meet its reliability requirements through a combination of economic merit order imports and internal generation without the purchase of out of merit capacity within the LDA. The regional transmission organization (RTO) market comprises the entire PJM footprint, unless an LDA is constrained. Each constrained LDA or group of LDAs is a separate market with a separate clearing price, and the RTO market is the balance of the footprint.

For the 2007/2008 and 2008/2009 Base Residual Auctions, the defined markets were RTO, EMAAC and SWMAAC. For the 2009/2010 Base Residual Auction, the defined markets were RTO, MAAC+APS and SWMAAC. The MAAC+APS LDA consists of the WMAAC, EMAAC, and SWMAAC LDAs, as shown in Figure A-3, plus the Allegheny Power System (APS or AP) Zone as shown in Figure A-1. For the 2010/2011 Base Residual Auction, the defined markets were RTO and DPL South. The DPL South LDA is shown in Figure A-4. For the 2011/2012 Base Residual Auction, the only defined market was RTO. For the 2012/2013 Base Residual Auction, the defined markets were RTO, MAAC, EMAAC, PSEG North, and DPL South. The PSEG North LDA is shown in Figure A-4. For the 2013/2014 Base Residual Auction, the defined markets were RTO, MAAC, EMAAC, and Pepco. For the 2014/2015 Base Residual Auction, the defined markets were RTO, MAAC, and PSEG North. For the 2015/2016 Base Residual Auction, the defined markets were RTO, MAAC, and ATSI. For the 2016/2017 Base Residual Auction, the defined markets were RTO, MAAC, PSEG, and ATSI.

PJM Market Milestones

Year	Month	Event
1996	April	FERC Order 888, "Promoting Wholesale Competition Through Open Access Non-discriminatory Transmission Services by Public Utilities; Recovery of Stranded Costs by Public Utilities and Transmitting Utilities"
1997	April	Energy Market with cost-based offers and market-clearing prices
	November	FERC approval of ISO status for PJM
1998	April	Cost-based Energy LMP Market
1999	January	Daily Capacity Market
	March	FERC approval of market-based rates for PJM
	March	Monthly and Multimonthly Capacity Market
	March	FERC approval of Market Monitoring Plan
	April	Offer-based Energy LMP Market
	April	FTR Market
2000	June	Regulation Market
	June	Day-Ahead Energy Market
	July	Customer Load-Reduction Pilot Program
2001	June	PJM Emergency and Economic Load-Response Programs
2002	April	Integration of AP Control Zone into PJM Western Region
	June	PJM Emergency and Economic Load-Response Programs
	December	Spinning Reserve Market
	December	FERC approval of RTO status for PJM
2003	May	Annual FTR Auction
2004	May	Integration of ComEd Control Area into PJM
	October	Integration of AEP Control Zone into PJM Western Region
	October	Integration of DAY Control Zone into PJM Western Region
2005	January	Integration of DLCO Control Zone into PJM
	May	Integration of Dominion Control Zone into PJM
2006	May	Balance of Planning Period FTR Auction
2007	April	First RPM Auction
	June	Marginal loss component in LMPs
2008	June	Day-Ahead Scheduling Reserve (DASR) Market
	August	Independent, External MMU created as Monitoring Analytics, LLC
	October	Long Term FTR Auction
	December	Modified Operating Reserve accounting rules
	December	Three Pivotal Supplier Test in Regulation Market
2011	June	Integration of ATSI Control Zone into PJM
2012	January	Integration of DEOK Control Zone into PJM
	October	Regulation Market: Slow and fast frequency response
	October	Scarcity pricing in Energy Market
2013	June	Integration of Eastern Kentucky Power Cooperative (EKPC) into PJM

Energy Market

This appendix provides more detailed information about load, locational marginal prices (LMP), offer-capped units and energy market uplift (operating reserves).

Load

Frequency Distribution of Load

Table C-1 provides the frequency distributions of PJM accounting load by hour, for 2007 through 2013.¹ The table shows the number of hours (frequency) and the percent of hours (cumulative percent) when the load was between 0 GWh and 20 GWh and then by five GWh intervals. The integrations of the AP Control Zone in 2002, the ComEd, AEP and DAY control zones in 2004, the DLCO and Dominion control zones in 2005, the ATSI Control Zone in 2011, the DEOK Control Zone in 2012, and the EKPC Control Zone in 2013 mean that annual comparisons of load frequency are significantly affected by PJM's geographic growth.²

Table C-1 Frequency distribution of PJM real-time, hourly load: 2007 through 2013^{3, 4}

Load (GWh)	2007		2008		2009		2010		2011		2012		2013

1 The definitions of load are discussed in the *Technical Reference for PJM Markets*, at "Load Definitions." <http://www.monitoringanalytics.com/reports/Technical_References/references.shtml>.

2 See the *2013 State of the Market Report for PJM*, Volume II, Appendix A, "PJM Geography."

3 Each range in the tables in this Appendix excludes the start value and includes the end value.

4 The 2012 data used to create the corresponding tables in the *2012 State of the Market Report for PJM* have been updated by PJM and the updates are included in this table.

Off-Peak and On-Peak Load

Table C-2 shows summary load statistics for 1998 through 2013 for the off-peak and on-peak hours. Table C-3 shows the annual change in each statistic. The on-peak period is defined for each weekday (Monday through Friday) as the hour ending 0800 to the hour ending 2300 Eastern Prevailing Time (EPT), excluding North American Electric Reliability Council (NERC) holidays.

Table C-2 Off-peak and on-peak load (MW): 1998 through 2013

	Average			Median			Standard Deviation		
	Off Peak	On Peak	On Peak/ Off Peak	Off Peak	On Peak	On Peak/ Off Peak	Off Peak	On Peak	On Peak/ Off Peak

Locational Marginal Price (LMP)

Three measures of LMP are calculated: average LMP; load-weighted average LMP; and fuel-cost-adjusted, load-weighted average LMP. Differences in average LMP measure the change in reported price. Differences in load-weighted average LMP measure the change in reported price weighted by the actual hourly MWh load to reflect what customers actually pay for energy. Differences in fuel-cost-adjusted, load-weighted average LMP measure the change in reported price actually paid by load after accounting for the change in price that reflects changes in fuel prices.⁵

The zonal LMP includes every bus in the zone and is not affected by the choices of LSEs. The zonal LMP is defined by weighting each load bus LMP by its hourly individual load bus contribution to the total zonal load. The LMP for a defined aggregate is calculated by weighting each included load bus LMP by its hourly contribution to the total load of the defined aggregate.

During the settlement process, total load that is assigned to a load serving entity (LSE) in a zone is settled based on the LSE's choice to be charged either at the zonal price or at nodal price. Any LSE may request to settle at nodal prices instead of zonal LMP, but the change can only take effect on June 1 of each year.⁶ If an LSE chooses to settle at nodal prices, the load of the LSE is distributed to all of the buses in the nodal aggregate using the LSE's nodal aggregate definition.⁷ If the LSE settles at the zonal price, the load of the LSE will be distributed to all of the buses in the zone using the zonal aggregate definition.⁸ After the LSE load is distributed to buses under either nodal or zonal prices, the LSE net bill is settled using MW of load at each bus in the defined aggregate and the LMP for that bus.

Market rules related to the use of zonal pricing will change starting with the 2015/2016 planning period.⁹ A residual zonal price will become the default price for load that has not elected to settle at nodal prices. When some load in a zone is nodally priced, the residual zonal price is the price of energy for the residual load, the

load that is not priced nodally. The residual price is the average price at the nodes at which non-nodal load is served. The zonal LMP will continue to be used for virtual bidding, Financial Transmission Rights (FTRs), and bilateral energy transactions.

In the Day-Ahead Energy Market buyers may submit bids at specific locations such as a transmission zone, aggregate or a single bus. Price sensitive demand bids specify price and MW quantities and a location for the bid. Market participants may submit increment offers or decrement bids at any hub, transmission zone, aggregate, single bus or eligible external interfaces. PJM provides the definitions of the transmission zones, aggregates, and single buses.¹⁰

⁵ See the *Technical Reference for PJM Markets*, at "Calculating Locational Marginal Price."

Real-Time LMP

Frequency Distribution of Real-Time Average LMP

Table C-4 provides frequency distributions of PJM real-time hourly average LMP for 2007 through 2013. The table shows the number of hours (frequency) and the percent of hours (cumulative percent) when the hourly PJM real-time LMP was, when negative, within a \$100 per MWh price interval below \$0 per MWh, or, when positive, within a given \$10 per MWh price interval and lower than \$300 per MWh, or within a given \$100 per MWh price interval and higher than \$300 per MWh.

Table C-4 Frequency distribution by hours of PJM Real-Time Energy Market LMP (Dollars per MWh): 2007 through 2013

Off-Peak and On-Peak, PJM Real-Time, Load-Weighted Average LMP

Table C-5 shows load-weighted, average real-time LMP for 2012 and 2013 during off-peak and on-peak periods.

Table C-5 Off-peak and on-peak, PJM load-weighted, average LMP (Dollars per MWh): 2012 and 2013

	2012			2013			Percent of 2012		
	Off Peak	On Peak	On Peak/ Off Peak	Off Peak	On Peak	On Peak/ Off Peak	Off Peak	On Peak	On Peak/ Off Peak
Average	\$28.49	\$41.61	1.46	\$31.88	\$45.06	1.41	11.9%	8.3%	(3.2%)
Median	\$26.89	\$33.67	1.25	\$29.18	\$37.46	1.28	8.5%	11.2%	2.5%
Standard deviation	\$13.56	\$28.85	2.13	\$13.13	\$29.19	2.22	(3.1%)	1.2%	4.4%

Off-Peak and On-Peak, Real-Time, Fuel-Cost-Adjusted, Load-Weighted, Average LMP

In a competitive market, changes in LMP result from changes in demand and changes in supply. Changes in LMP can result from changes in the marginal costs of marginal units, the units setting LMP. As competitive offers are the short run marginal cost of generation and fuel costs make up between 80 percent and 90 percent of short run marginal cost on average, fuel cost is a key factor affecting the competitive clearing price. In a competitive market, if fuel costs increase and nothing else changes, the competitive price also increases.

The impact of fuel cost on marginal cost and on LMP depends on the fuel burned by marginal units and changes in fuel costs.¹¹ Changes in emission allowance costs are another contributor to changes in the marginal cost of marginal units. To account for the changes in fuel and allowance costs between 2012 and 2013, the load-weighted, average LMP for 2013 was adjusted to reflect the daily price of fuels and emission allowances used by marginal units from a base period, 2012. The fuel cost adjusted, load-weighted, average LMP for 2013 is compared to the load-weighted, average LMP for 2012 and load-weighted, average LMP for 2013.¹²

Table C-6 shows the real-time, load-weighted, average LMP for 2012 and the real-time, fuel-cost-adjusted, load-weighted, average LMP for 2013 for on-peak and off-peak hours. The fuel-cost adjusted load-weighted, average LMP for 2013 on-peak hours was 5.7 percent lower than the load-weighted, average LMP for 2012 on-peak hours. If the fuel costs had been the same as

in 2012, holding everything else constant, the 2013 real time load weighted, average LMP for on-peak hours would have been lower, \$39.24 per MWh instead of the observed \$45.06 per MWh. The fuel-cost adjusted load-weighted, average LMP for 2013 off-peak hours was 3.1 percent higher than the load-weighted, average LMP for 2012 off-peak hours. If the fuel costs had been the same as in 2012, holding everything else constant, the 2013 real time load weighted, average LMP for off-peak hours would have been lower, \$29.38 per MWh instead of the observed \$31.88 per MWh. The mix of fuel types and costs in 2013 resulted in higher prices in 2013 for both on peak and off peak periods than would have occurred if fuel prices had remained at their 2012 levels, although the difference was larger for the on peak period than for the off peak period.

Table C-6 On-peak and off-peak real-time PJM fuel-cost-adjusted, load-weighted, average LMP (Dollars per MWh): 2013

	2012 Load- Weighted LMP	2013 Fuel-Cost- Adjusted, Load- Weighted LMP	Change	2013 Load- Weighted LMP	Change
Off Peak	\$28.49	\$29.38	3.1%	\$31.88	8.5%
On Peak	\$41.61	\$39.24	(5.7%)	\$45.06	14.8%

¹¹ See the 2013 *State of the Market Report for PJM*, Volume II, Section 3, "Energy Market," at Table 3-16, "Type of fuel used (By marginal units): 2013."

¹² See the *Technical Reference for PJM Markets*, at "Calculation and Use of Generator Sensitivity/ Unit Participation Factors."

PJM Real-Time, Load-Weighted Average LMP during Constrained Hours

Table C-7 shows the PJM load-weighted, average LMP during constrained hours for 2012 and 2013.¹³

Table C-7 PJM real-time load-weighted, average LMP during constrained hours (Dollars per MWh): 2012 and 2013

	2012	2013	Percent of 2012
Average	\$36.52	\$40.31	10.4%
Median	\$31.03	\$34.16	10.1%
Standard deviation	\$24.67	\$25.53	3.5%

Table C-8 provides a comparison of PJM load-weighted, average LMP during constrained and unconstrained hours for 2012 and 2013.

Table C-8 PJM real-time load-weighted, average LMP during constrained and unconstrained hours (Dollars per MWh): 2012 and 2013

	2012			2013		
	Unconstrained Hours	Constrained Hours	Percent of Unconstrained	Unconstrained Hours	Constrained Hours	Percent of Unconstrained
Average	\$26.36	\$36.52	38.5%	\$31.20	\$40.31	29.2%
Median	\$27.43	\$31.03	13.1%	\$29.71	\$34.16	15.0%
Standard deviation	\$11.56	\$24.67	113.3%	\$10.30	\$25.53	147.8%

Table C-9 shows the number of hours and the number of constrained hours in each month in 2012 and 2013.

Table C-9 PJM real-time constrained hours: 2012 and 2013

	2012			2013		
	Constrained Hours	Total Hours	Percent of Total	Constrained Hours	Total Hours	Percent of Total
Jan	537	744	72.2%	658	744	88.4%
Feb	633	696	90.9%	625	672	93.0%
Mar	661	743	89.0%	621	743	83.6%
Apr	669	720	92.9%	538	720	74.7%
May	632	744	84.9%	564	744	75.8%
Jun	505	720	70.1%	591	720	82.1%
Jul	676	744	90.9%	587	744	78.9%
Aug	630	744	84.7%	460	744	61.8%
Sep	649	720	90.1%	620	720	86.1%
Oct	724	744	97.3%	602	744	80.9%
Nov	663	721	92.0%	598	721	82.9%
Dec	625	744	84.0%	586	744	78.8%
Avg	634	732	86.6%	588	730	80.5%

¹³ A constrained hour, or a constraint hour, is any hour during which one or more facilities are congested. In order to have a consistent metric for real-time and day-ahead congestion frequency, real-time congestion frequency is measured using the convention that an hour is constrained if any of its component five-minute intervals is constrained. This is consistent with the way in which PJM reports real-time congestion.

Day-Ahead and Real-Time LMP

On average, prices in the Real-Time Energy Market in 2013 were slightly higher than those in the Day-Ahead Energy Market and real-time prices showed greater dispersion. This pattern of system average LMP distribution for 2013 can be seen by comparing Table C-4 and Table C-10. Table C-10 shows frequency distributions of PJM day-ahead hourly LMP for the years 2007 through 2013. Together the tables show the frequency distribution by hours for the two markets. In the Real-Time Energy Market, prices reached a high for the year of \$465.18 per MWh on July 18, 2013, in the hour ending 1400 EPT. In the Day-Ahead Energy Market, prices reached a high for the year of \$315.60 per MWh on July 17, 2013, in the hour ending 1700 EPT.

Table C-10 Frequency distribution by hours of PJM Day-Ahead Energy Market LMP (Dollars per MWh): 2007 through 2013

Off-Peak and On-Peak, Day-Ahead and Real-Time, Average LMP

Table C-11 shows PJM average LMP during off-peak and on-peak periods for the Day-Ahead and Real-Time Energy Markets in 2013. Figure C-1 and Figure C-2 show the difference between real-time and day-ahead LMP in 2013 during the on-peak and off-peak hours.

Table C-11 Off-peak and on-peak, average day-ahead and real-time LMP (Dollars per MWh): 2013

	Day Ahead			Real Time			Percent of Real Time		
	Off Peak	On Peak	On Peak/ Off Peak	Off Peak	On Peak	On Peak/ Off Peak	Off Peak	On Peak	On Peak/ Off Peak
Average	\$31.50	\$43.63	1.39	\$30.72	\$43.24	1.41	(2.5%)	(0.9%)	1.6%
Median	\$30.19	\$39.67	1.31	\$28.44	\$36.75	1.29	(6.2%)	(8.0%)	(1.7%)
Standard deviation	\$7.59	\$19.20	2.53	\$11.99	\$25.69	2.14	36.7%	25.3%	(18.1%)

Figure C-1 Hourly real-time LMP minus day-ahead LMP (On-peak hours): 2013

Figure C-2 Hourly real-time LMP minus day-ahead LMP (Off-peak hours): 2013

On-Peak and Off-Peak, Zonal, Day-Ahead and Real-Time, Average LMP

Table C-12 and Table C-13 show the on-peak and off-peak, average LMP for each zone in the Day-Ahead and Real-Time Energy Markets in 2012 and 2013.

Table C-12 On-peak, zonal, average day-ahead and real-time LMP (Dollars per MWh): 2012 and 2013

Offer-Capped Units

PJM's market power mitigation goals have focused on market designs that promote competition and that limit market power mitigation to situations where market structure is not competitive and thus where market design alone cannot mitigate market power. In the PJM Energy Market, this situation occurs primarily in the case of local market power. Offer capping occurs as a result of structurally noncompetitive local markets and noncompetitive offers in the Day-Ahead and Real-Time Energy Markets. PJM also uses offer capping for units that are committed for reliability reasons, specifically for providing black start, reactive service and for units committed manually as part of conservative operations.

PJM has clear rules limiting the exercise of local market power.¹⁴ The rules provide for offer capping when conditions on the transmission system create a structurally noncompetitive local market, when units in that local market have made noncompetitive offers and when such offers would set the price above the competitive level in the absence of mitigation. Offer caps are set at the level of a competitive offer. Offer-capped units receive the higher of the market price or their offer cap. Thus, if broader market conditions lead to a price greater than the offer cap, the unit receives the higher market price. The rules governing the exercise of local market power recognize that units in certain areas of the system would be in a position to extract monopoly profits, but for these rules.

¹⁴ See OA Schedule 1, § 6.4.2.

Under existing rules, PJM suspends offer capping when structural market conditions, as determined by the three pivotal supplier test, indicate that suppliers are reasonably likely to behave in a competitive manner.¹⁵ The goal is to apply a clear rule to limit the exercise of market power by generation owners in load pockets, but to apply the rule in a flexible manner in real time and to lift offer capping when the exercise of market power is unlikely based on the real-time application of the market structure screen.

Levels of offer capping have generally been low and stable over the last five years. Table C-27 through Table C-30 show offer capping by month, including the number of offer-capped units and the level of offer-capped MW in the Day-Ahead and Real-Time Energy Markets. The statistics include units that are capped for failing the TPS test to provide constraint relief as well as units committed on their cost schedule for reliability reasons (reactive support, black start service and conservative operations).

Credits and Charges to Generators

Table C-37 and Table C-38 compare the share of balancing operating reserve charges paid by generators and balancing operating reserve credits paid to generators in the Eastern Region and the Western Region. Generator charges are defined in these tables as the allocation of charges paid by generators due to generator deviations from day-ahead schedules or not following PJM dispatch.

Table C-37 shows that on average, 14.7 percent of the RTO and Eastern Region balancing generator charges, including lost opportunity cost and canceled resources charges, were paid by generators deviating in the Eastern Region while these generators received 77.0 percent of all balancing generator credits.

Table C-37 Monthly balancing operating reserve charges and credits to generators (Eastern Region): 2013

	Generators RTO Deviation Charges	Generators Regional Deviation Charges	Generators LOC and Canceled Resources Charges	Total Charges	Balancing, LOC and Canceled Resources Credits
Jan	\$2,079,890	\$7,240,873	\$1,228,859	\$10,549,622	\$67,291,143
Feb	\$554,118	\$10,894,186	\$503,715	\$11,952,018	\$62,212,984

Energy Uplift Charges by Transaction/Resource Type

Table C-40 shows the energy uplift charges and applicable rates for each type of resource or transaction in PJM.

Table C-40 Energy uplift charge by transaction/resource type

Charge	Rate	Transaction / Resource Type									
		Load	Generation	Imports ¹	Exports ¹	Wheels	Economic DR	INCs	DECs	IBTs	UTCs
Day-Ahead Operating Reserve	Day-Ahead Operating Reserve Rate	X			X				X		
Balancing Operating Reserves for Reliability	RTO Reliability Rate	X			X						
	Regional (East or West) Reliability Rate	X			X						
Balancing Operating Reserves for Deviations ²	RTO Deviation Rate	X	X	X	X		X	X	X	X	
	Regional (East or West) Deviation Rate	X	X	X	X		X	X	X	X	
	LOC Rate	X	X	X	X		X	X	X	X	
	Canceled Resources Rate	X	X	X	X		X	X	X	X	
Reactive Services	Implicit Rates	X									
Black Start Services	Implicit Rates	X ³		X ⁴	X ⁴	X ⁴					
Synchronous Condensing	Implicit Rate	X			X						

¹ Dynamic scheduled transactions are exempt from operating reserve charges.

² Participants only pay deviation charges if they incur deviations based on the rules specified in Manual 28.

³ Load is charged black start services based on their zonal peak load contribution.

⁴ Interchange transactions are charged black start services based on their point to point firm and non-firm reservations.

Local Energy Market Structure: TPS Results

The three pivotal supplier test is applied by PJM on an ongoing basis in order to determine whether structural market power requires offer capping to prevent the potential exercise of local market power for binding constraints.

The MMU analyzed the results of the three pivotal supplier tests conducted by PJM for the Real-Time Energy Market for the period January 1, 2013, through December 31, 2013. The three pivotal supplier test is applied every time the system solution indicates that out of merit resources are needed to relieve a transmission constraint. Only uncommitted resources, which would be started to relieve the transmission constraint, are subject to offer capping. Already committed units that can provide incremental relief cannot be offer capped if they were committed for another reason. The results of the TPS test are shown for tests that could have resulted in offer capping and tests that did result in offer capping.

Overall, the results confirm that the three pivotal supplier test results in offer capping when the local market is structurally noncompetitive and does not result in offer capping when that is not the case. Local markets are noncompetitive when the number of suppliers is relatively small.

This appendix provides data on the TPS tests that were applied in PJM control zones that had congestion from one or more constraints for 100 or more hours, provided that the average number of suppliers that provided relief for the constraints is greater than three.¹ In 2013, the AECO, AEP, ATSI, BGE, ComEd, Dominion, DPL, PECO, PENELEC, Pepco, PPL and PSEG control zones experienced congestion resulting from one or more constraints binding for 100 or more hours. Using the three pivotal supplier results for 2013, actual competitive conditions associated with each of these frequently binding constraints were analyzed for the Real Time Energy Market.² The AP, DAY, DEOK, DLCO, JCPL, Met-Ed, and RECO control zones were

not affected by constraints binding for 100 or more hours. Information is provided, by qualifying zone, for each constraint including the number of tests applied, the number of tests that could have resulted in offer capping and the number of tests that did result in offer capping.³ Additional information is provided for each constraint including the average MW required to relieve a constraint, the average supply available, the average number of owners included in each test and the average number of owners that passed or failed each test.

AECO Control Zone Results

In 2013, there was one constraint that occurred for more than 100 hours in the AECO Control Zone.⁴

AEP Control Zone Results

In 2013, there were five constraints that occurred for more than 100 hours in the AEP Control Zone. Table D-1 shows the average constraint relief required on the constraint, the average effective supply available to relieve the constraint, the average number of owners with available relief in the defined market and the average number of owners passing and failing for the one constraint for which data can be published. On average, there was one owner with available supply on peak and off peak for three of the five constraints in the AEP Control Zone. Table D-1 shows that for the constraint at Cloverdale, on average, there were eight owners on peak and seven owners off peak with available supply.

¹ Under the PJM confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for constraints where the number of suppliers that provided relief is less than four. See PJM. "Manual 33 Administrative Services for the PJM Interconnection Operating Agreement," Revision 9 (July 22, 2012), Market Data Posting.

² See the *Technical Reference for PJM Markets*, at "Three Pivotal Supplier Test" for a more detailed explanation of the three pivotal supplier test.

³ The three pivotal supplier test in the Real-Time Energy Market is applied by PJM as necessary and may be applied multiple times within a single hour for a specific constraint. Each application of the test is done in a five-minute interval.

⁴ Under the PJM confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for constraints where the number of suppliers that provided relief is less than four. See PJM. "Manual 33 Administrative Services for the PJM Interconnection Operating Agreement," Revision 9 (July 22, 2012), Market Data Posting.

Table D-1 Three pivotal supplier test details for constraints located in the AEP Control Zone: 2013

Constraint	Period	Average Constraint Relief (MW)	Average Effective Supply (MW)	Average Number Owners	Average Number Owners Passing	Average Number Owners Failing
Cloverdale	Peak	80	107	8	0	8
	Off Peak	60	84	7	0	7

Table D-2 shows the total tests applied for the Cloverdale constraint in the AEP Zone, the subset of three pivotal supplier tests that could have resulted in offer capping and the portion of those tests that did result in offer capping. The results reflect the fact that units that are already running cannot be offer capped. Only uncommitted units, which would be started to provide constraint relief, are eligible to be offer capped. Table D-2 shows that for the constraint at Cloverdale in the AEP Zone, six percent or less of the total tests applied resulted in offer capping.

Table D-2 Summary of three pivotal supplier tests applied to uncommitted units for constraints located in the AEP Control Zone: 2013

Constraint	Period	Total Tests Applied	Total Tests that Could Have Resulted in Offer Capping	Percent Total Tests that Could Have Resulted in Offer Capping	Total Tests Resulted in Offer Capping	Percent Total Tests Resulted in Offer Capping	Tests Resulted in Offer Capping as Percent of Tests that Could Have Resulted in Offer Capping
Cloverdale	Peak	205	21	10%	12	6%	57%
	Off Peak	697	14	2%	2	0%	14%

ATSI Control Zone Results

In 2013, there was only one constraint in the ATSI Control Zone that occurred for more than 100 hours.⁵ Due to confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for the constraint in the ATSI Control Zone.

BGE Control Zone Results

In 2013, there was one constraint that occurred for more than 100 hours in the BGE Control Zone. Table D-3 shows the average constraint relief required on the constraint, the average effective supply available to relieve the constraint, the average number of owners with available relief in the defined market and the average number of owner passing and failing. Table D-3 shows that for the Bagley – Graceton constraint, there were nine owners, on average, with available supply to relieve the constraint on peak and seven owners off peak.

Table D-3 Three pivotal supplier test details for constraints located in the BGE Control Zone: 2013

Constraint	Period	Average Constraint Relief (MW)	Average Effective Supply (MW)	Average Number Owners	Average Number Owners Passing	Average Number Owners Failing
Bagley – Graceton	Peak	44	85	9	3	6
	Off Peak	37	66	7	1	6

Table D-4 shows the total tests applied for the Bagley – Graceton constraint in the BGE Zone, the subset of three pivotal supplier tests that could have resulted in offer capping and the portion of those tests that did result in offer capping. The results reflect the fact that units that are already running cannot be offer capped. Only uncommitted units, which would be started to provide constraint relief, are eligible to be offer capped. Table D-4 shows that two percent or fewer of the tests applied to the constraint in the BGE Zone could have resulted in offer capping and that less than one percent of the tests resulted in offer capping.

⁵ Under the PJM confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for constraints where the number of suppliers that provided relief is less than four. See PJM, "Manual 33 Administrative Services for the PJM Interconnection Operating Agreement," Revision 9 (July 22, 2012), Market Data Posting.

Table D-4 Summary of three pivotal supplier tests applied to uncommitted units for constraints located in the BGE Control Zone: 2013

Constraint	Period	Total Tests Applied	Total Tests that Could Have Resulted in Offer Capping	Percent Total Tests that Could Have Resulted in Offer Capping	Total Tests Resulted in Offer Capping	Percent Total Tests Resulted in Offer Capping	Tests Resulted in Offer Capping as Percent of Tests that Could Have Resulted in Offer Capping
Bagley - Graceton	Peak	2,418	38	2%	4	0%	11%
	Off Peak	1,677	13	1%	2	0%	15%

ComEd Control Zone Results

In 2013, there were five constraints that occurred for more than 100 hours in the ComEd Control Zone.⁶

Dominion Control Zone Results

In 2013, there were four constraints that occurred for more than 100 hours in the Dominion Control Zone. Table D-5 shows the average constraint relief required on the constraint, the average effective supply available to relieve the constraint, the average number of owners with available relief in the defined market and the average number of owner passing and failing for the two constraints for which data can be published. Table D-5 shows that for both of the constraints, on average, there were eleven owners with available supply to relieve the constraint on peak.

Table D-5 Three pivotal supplier test details for constraints located in the Dominion Control Zone: 2013

Constraint	Period	Average Constraint Relief (MW)	Average Effective Supply (MW)	Average Number Owners	Average Number Owners Passing	Average Number Owners Failing
Clover	Peak	134	182	11	0	10
	Off Peak	156	213	10	0	10
Mt. Storm	Peak	215	334	11	1	10
	Off Peak	250	365	8	1	7

Table D-6 shows the total tests applied for two of the four constraints in the Dominion Zone, the subset of three pivotal supplier tests that could have resulted in offer capping and the portion of those tests that did result in offer capping. The results reflect the fact that units that are already running cannot be offer capped. Only uncommitted units, which would be started to provide constraint relief, are eligible to be offer capped. Table D-6 shows that two percent or fewer of the tests applied to the constraints at Clover and Mt. Storm in the Dominion Zone resulted in offer capping.

Table D-6 Summary of three pivotal supplier tests applied to uncommitted units for constraints located in the Dominion Control Zone: 2013

Constraint	Period	Total Tests Applied	Total Tests that Could Have Resulted in Offer Capping	Percent Total Tests that Could Have Resulted in Offer Capping	Total Tests Resulted in Offer Capping	Percent Total Tests Resulted in Offer Capping	Tests Resulted in Offer Capping as Percent of Tests that Could Have Resulted in Offer Capping
Clover	Peak	765	41	5%	15	2%	37%
	Off Peak	688	14	2%	4	1%	29%
Mt. Storm	Peak	654	8	1%	0	0%	0%
	Off Peak	762	7	1%	0	0%	0%

⁶ Under the PJM confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for constraints where the number of suppliers that provided relief is less than four. See PJM, "Manual 33 Administrative Services for the PJM Interconnection Operating Agreement," Revision 9 (July 22, 2012), Market Data Posting.

DPL Control Zone Results

In 2013, there was one constraint that occurred for more than 100 hours in the DPL Control Zone.⁷

PECO Control Zone Results

In 2013, there was one constraint that occurred for more than 100 hours in the PECO Control Zone.⁸

PENELEC Control Zone Results

In 2013, there was one constraint that occurred for more than 100 hours in the PENELEC Control Zone.⁹

Pepco Control Zone Results

In 2013, there was one constraint that occurred for more than 100 hours in the Pepco Control Zone. Table D-7 shows the average constraint relief required on the constraint, the average effective supply available to relieve the constraint, the average number of owners with available relief in the defined market and the average number of owner passing and failing. Table D-7 shows that on average, there were eleven owners with available supply to relieve the Dickerson – Pleasant View constraint.

Table D-7 Three pivotal supplier test details for constraints located in the Pepco Control Zone: 2013

Constraint	Period	Average Constraint Relief (MW)	Average Effective Supply (MW)	Average Number Owners	Average Number Owners Passing	Average Number Owners Failing
Dickerson – Pleasant View	Peak	108	168	11	2	9
	Off Peak	111	178	11	2	9

Table D-8 shows the total tests applied for the Dickerson – Pleasant View constraint in the Pepco Zone, the subset of three pivotal supplier tests that could have resulted in offer capping and the portion of those tests that did result in offer capping. The results reflect the fact that units that are already running cannot be offer capped. Only uncommitted units, which would be started to provide constraint relief, are eligible to be offer capped. Table D-8 shows that only 25 of the 738 tests applied on peak to the constraint in the Pepco Zone could have resulted in offer capping.

Table D-8 Summary of three pivotal supplier tests applied to uncommitted units for constraints located in the Pepco Control Zone: 2013

Constraint	Period	Total Tests Applied	Total Tests that Could Have Resulted in Offer Capping	Percent Total Tests that Could Have Resulted in Offer Capping	Total Tests Resulted in Offer Capping	Percent Total Tests Resulted in Offer Capping	Tests Resulted in Offer Capping as Percent of Tests that Could Have Resulted in Offer Capping
Dickerson – Pleasant View	Peak	738	25	3%	14	2%	56%
	Off Peak	98	0	0%	0	0%	0%

⁷ Under the PJM confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for constraints where the number of suppliers that provided relief is less than four. See PJM. "Manual 33 Administrative Services for the PJM Interconnection Operating Agreement," Revision 9 (July 22, 2012), Market Data Posting.

⁸ Under the PJM confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for constraints where the number of suppliers that provided relief is less than four. See PJM. "Manual 33 Administrative Services for the PJM Interconnection Operating Agreement," Revision 9 (July 22, 2012), Market Data Posting.

⁹ Under the PJM confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for constraints where the number of suppliers that provided relief is less than four. See PJM. "Manual 33 Administrative Services for the PJM Interconnection Operating Agreement," Revision 9 (July 22, 2012), Market Data Posting.

PPL Control Zone Results

In 2013, there was one constraint that occurred for more than 100 hours in the PPL Control Zone.¹⁰

PSEG Control Zone Results

In 2013, there were two constraints that occurred for more than 100 hours in the PSEG Control Zone. For both the constraints in the PSEG Zone, the number of suppliers with available relief was four or less. Table D-9 shows the average constraint relief required on the constraint, the average effective supply available to relieve the constraint, the average number of owners with available relief in the defined market and the average number of owner passing and failing for the one constraint for which data can be published. Table D-9 shows that for the Bridgewater – Middlesex constraint, the average number of owners with available supply was four.

Table D-9 Three pivotal supplier test details for constraints located in the PSEG Control Zone: 2013

Constraint	Period	Average Constraint Relief (MW)	Average Effective Supply (MW)	Average Number Owners	Average Number Owners Passing	Average Number Owners Failing
Bridgewater – Middlesex	Peak	32	36	4	0	4
	Off Peak	27	28	4	0	4

Table D-10 shows the total tests applied for the Bridgewater – Middlesex constraint in the PSEG Zone, the subset of three pivotal supplier tests that could have resulted in offer capping and the portion of those tests that did result in offer capping. The results reflect the fact that units that are already running cannot be offer capped. Only uncommitted units, which would be started to provide constraint relief, are eligible to be offer capped. Table D-10 shows that three percent or fewer of the tests applied to the Bridgewater – Middlesex constraint in the PSEG Zone could have resulted in offer capping.

Table D-10 Summary of three pivotal supplier tests applied to uncommitted units for constraints located in the PSEG Control Zone: 2013

Constraint	Period	Total Tests Applied	Total Tests that Could Have Resulted in Offer Capping	Percent Total Tests that Could Have Resulted in Offer Capping	Total Tests Resulted in Offer Capping	Percent Total Tests Resulted in Offer Capping	Tests Resulted in Offer Capping as Percent of Tests that Could Have Resulted in Offer Capping
Bridgewater – Middlesex	Peak	1,884	25	1%	23	1%	92%
	Off Peak	237	7	3%	4	2%	57%

¹⁰ Under the PJM confidentiality rules, the MMU cannot publish details of the three pivotal supplier test for constraints where the number of suppliers that provided relief is less than four. See PJM, "Manual 33 Administrative Services for the PJM Interconnection Operating Agreement," Revision 9 (July 22, 2012), Market Data Posting.

Interchange Transactions

Submitting Transactions into PJM

In competitive wholesale power markets, market participants' decisions to buy and sell power are based on actual and expected prices. If contiguous wholesale power markets incorporate security constrained nodal pricing, well designed interface pricing provides economic signals for import and export decisions by market participants, although those signals may be attenuated by a variety of institutional arrangements.

In order to understand the data on imports and exports, it is important to understand the institutional details of completing import and export transactions. These include the Open Access Same-Time Information System (OASIS), North American Electric Reliability Council (NERC) Tags, neighboring balancing authority check out processes, and transaction curtailment rules.¹

Real-Time Market

Market participants that wish to transact energy into, out of, or through PJM in the Real-Time Energy Market are required to make their requests to PJM via the NERC Interchange Transaction Tag (NERC Tag). PJM's Enhanced Energy Scheduler (EES) software interfaces with NERC Tags to create an interface that both PJM market participants and PJM can use to evaluate and manage external transactions that affect the PJM RTO.

All PJM interchange transactions are required to be at least 45 minutes in duration. However, PJM system operators may make adjustments that cause a transaction or interval(s) of the transaction to violate this minimum duration.

Scheduling Requirements

External offers can be made either on the basis of an individual generator (resource specific offer) or an aggregate of generation supply (aggregate offer). Schedules are submitted to PJM by submitting a valid NERC Tag.

Specific timing requirements apply for the submission of schedules. Schedules can be submitted up to 20 minutes prior to the scheduled start time for hourly transactions. Schedules can be submitted up to 4 hours prior to the scheduled start time for transactions that are more than 24 hours in duration. For a schedule to be included in PJM's day-ahead checkout process, the NERC Tag must be approved by all entities who have approval rights, and be in a status of "Implemented", by 1400 (EPT) one day prior to start of schedule. Schedules utilizing the Real-Time with Price option, also known as dispatchable schedules, must be submitted prior to 1200 noon (EPT) the day prior to the scheduled start time. Schedules utilizing firm point-to-point transmission service must be submitted by 1000 (EPT) one day prior to start of schedule. Transactions utilizing firm point-to-point transmission submitted after 1000 (EPT) one day prior will be accommodated if practicable.

Acquiring Ramp

PJM allows market participants to reserve ramp while they complete their scheduling responsibilities. The ramp reservation is validated against the submitted NERC Tag to ensure the energy profile and path matches. Upon submission of a ramp reservation request, if PJM verifies ramp availability, the ramp reservation will move into a status of "Pending Tag" which means that it is a valid reservation that can be associated with a NERC Tag to complete the scheduling process.

Specific timing requirements apply for the submission of ramp reservations. Ramp reservations can be made up to 30 minutes prior to the scheduled start time for hourly transactions. Ramp reservations can be made up to 4 hours prior to start time for transactions that are more than 24 hours in duration. Ramp reservations utilizing the Real-Time with Price option must be made prior to 1200 noon (EPT) the day prior to the scheduled start time. Ramp reservations expire if they are not used.

Acquiring Transmission

All external transaction requests require a confirmed transmission reservation from the PJM OASIS.² Due to ramp limitations, PJM may require market participants to shift their transaction requests. If the market participant

¹ The material in this section is based in part on PJM's Regional Transmission and Energy Scheduling Practices Document. See PJM, "Regional Transmission and Energy Scheduling Practices," Version 20 (December 5, 2013). (Accessed February 25, 2014) <<http://www.pjm.com/~media/etools/oasis/regional-practices-clean-doc.ashx>> (448 KB).

² For additional details see PJM, "PJM Regional Practices document," <<http://oasis.pjm.com>> (Accessed January 23, 2014).

shifts the request up to one hour in either direction, they are not required to purchase additional transmission. If the market participant chooses to fix a ramp violation by extending the duration of the transaction, they do not have to purchase additional transmission if the total MWh capacity of the transmission request is not exceeded, and the transaction does not extend beyond one hour prior to the start, or one hour past the end time of the transmission reservation.

Transmission Products

The OASIS products available for reservation include firm, network, non-firm and spot import service. The product type designated on the OASIS reservation determines when and how the transaction can be curtailed.

- **Firm.** Transmission service that is intended to be available at all times.
- **Network.** Transmission service that is for the sole purpose of serving network load. Network transmission service is only eligible to network customers.
- **Non-Firm.** Point-to-point transmission service under the PJM tariff that is reserved and scheduled on an as available basis and is subject to curtailment or interruption. Non-firm point-to-point transmission service is available for periods ranging from one hour to one month.
- **Spot Import.** The spot import service is an option for non-load serving entities to offer into the PJM spot market at the interface as price takers. Prior to April 2007, PJM did not limit spot import service. Effective April 2007, the availability of spot import service was limited by the Available Transmission Capacity (ATC) on the transmission path.

Source and Sink

For a real-time import energy transaction, when a market participant selects the Point of Receipt (POR) and Point of Delivery (POD) on their OASIS reservation, the source defaults to the associated interface price as defined by the POR/POD path. For example, if the selected POR is TVA and the POD is PJM, the source would initially default to TVA's Interface Pricing point (SouthIMP). At the time the energy is scheduled, if the Generation Control Area (GCA) on the NERC Tag represents physical flow entering PJM at an interface other than

the SouthIMP Interface, the source would then default to that new interface. The sink bus is selected by the market participant at the time the OASIS reservation is made and can be any bus, hub or aggregate in the PJM footprint where LMP is calculated.

For a real-time export energy transaction, when a market participant selects the Point of Receipt (POR) and Point of Delivery (POD) on their OASIS reservation, the sink defaults to the associated interface price as defined by the POR/POD path. For example, if the selected POR is PJM and the POD is TVA, the sink would initially default to TVA's Interface Pricing point (SouthEXP). At the time the energy is scheduled, if the Load Control Area (LCA) on the NERC Tag represents physical flow leaving PJM at an interface other than the SouthEXP Interface, the sink would then default to that new interface. The source bus is selected by the market participant at the time the OASIS reservation is made and can be any bus, hub or aggregate in the PJM footprint where LMP is calculated.

For a real-time wheel through energy transaction, when a market participant selects the Point of Receipt (POR) and Point of Delivery (POD) on their OASIS reservation, both the source and sink default to the associated interface prices as defined by the POR/POD path. For example, if the selected POR is TVA and the POD is NYIS, the source would initially default to TVA's Interface Pricing point (SouthIMP), and the sink would initially default to NYIS's Interface Pricing point (NYIS). At the time the energy is scheduled, if the GCA on the NERC Tag represents physical flow entering PJM at an interface other than the SouthIMP Interface, the source would then default to that new interface. Similarly, if the LCA on the NERC Tag represents physical flow leaving PJM at an interface other than the NYIS Interface, the sink would then default to that new interface.

Real-Time Market Schedule Submission

Market participants enter schedules in PJM by submitting a valid NERC Tag. A NERC Tag can be submitted without a ramp reservation. When EES detects a NERC Tag that has been submitted without a ramp reservation, it will create a ramp reservation which will be evaluated against ramp, and approved or denied based on available ramp room at the time the NERC Tag is submitted.

Real-Time with Price Schedule Submission

Real-Time with Price schedules, also known as dispatchable schedules, differ from other schedules. To enter a Real-Time with Price schedule, the market participant must first make a ramp reservation in EES specifying “Real-Time with Price” and must enter a price associated with each energy block. Upon submission, the Real-Time with Price request will automatically move to the “Pending Tag” status, as Real-Time with Price schedules do not hold ramp. Once the information is entered in EES, a NERC Tag must be submitted with the ramp reservation associated on the NERC Tag. Upon implementation of the NERC Tag, PJM will curtail the tag to 0 MW. During the operating day, if the dispatchable transaction is to be loaded, PJM will then reload the tag. The process of issuing curtailments and reloading the tag continues through the operating day as the economics of the system dictate.

Dynamic Schedule Requirements

An entity that owns or controls a generating resource in the PJM Region may request that all or part of the generating resource’s output be removed from the PJM Region, via dynamic scheduling of the output, to a load outside the PJM Region. An entity that owns or controls a generating resource outside of the PJM Region may request that all or part of the generating resource’s output be added to the PJM Region, via dynamic scheduling of the output, to a load inside the PJM Region. Due to the complexity of these arrangements, requesting entities must coordinate with PJM and complete several steps before a dynamic schedule can be implemented. The requesting entity is responsible for submitting a dynamic NERC Tag to match the scheduled output of the generating resource.

Real-Time Evaluation and Checkout

PJM conducts an hourly checkout with each adjacent balancing authority using both the electronic approval of schedules and telephone calls. Once the tag has been approved by all parties with approval rights, the tag status moves to an “Implemented” status, and the schedule is ready for the adjacent balancing authority checkout.

PJM operators must verify all requested energy schedules with PJM’s neighboring balancing authorities.

Only if the neighboring balancing authority agrees with the expected interchange will the transaction flow. Both balancing authorities must enter the same values in their Energy Management Systems (EMS) to avoid inadvertent energy flows between balancing authorities.

With the exception of the New York Independent System Operator (NYISO), all neighboring balancing authorities handle transaction requests in the same way as PJM. While the NYISO also requires NERC Tags, the NYISO utilizes their Market Information System (MIS) as their primary scheduling tool. The NYISO’s real-time commitment (RTC) tool evaluates all bids and offers each hour, performs a least cost economic dispatch solution, and accepts or denies individual transactions in whole or in part based on this evaluation. Upon market clearing, the NYISO implements NERC Tag adjustments to match the output of the RTC. PJM and the NYISO can verify interchange transactions once the NYISO Tag adjustments are sent and approved. The results of the adjustments made by the NYISO affect PJM operations, as the adjustments often cause large swings in expected ramp for the next hour.

Real-Time with Price Evaluation and Checkout

Real-time with price schedules, also known as dispatchable schedules, are evaluated hourly to determine whether or not they will be loaded for the upcoming hour. Since real-time with price schedules do not hold ramp room, there may be times when the schedule is economic but will not be loaded because ramp is not available.

Curtailment of Transactions

Once a transaction has been implemented, energy flows between balancing authorities. Transactions can be curtailed based on economic and reliability considerations. There are three types of economic curtailments: curtailments of dispatchable schedules based on price; curtailments of transactions based on their OASIS designation as not willing to pay congestion; and self curtailments by market participant. Reliability curtailments are implemented by the balancing authorities and are termed TLRs or transmission loading relief.

Dispatchable transactions will be curtailed if the system operator does not believe that the transaction will be economic for the next hour. Not willing to pay congestion transactions will be curtailed if there is realized congestion between the designated source and sink. Transactions utilizing spot import service will be curtailed if the interface price where the transaction enters PJM reaches zero. All self curtailments must be requested on 15 minute intervals and will be approved only if there is available ramp.

Transmission Loading Relief (TLR)

TLRs are called to control flows on transmission facilities when economic redispatch cannot solve overloads on those facilities. TLRs are called to control flows related to external balancing authorities, as redispatch within an LMP market can generally resolve overloads on internal transmission facilities.

There are seven TLR levels and additional sublevels, determined by the severity of system conditions and whether the interchange transactions contributing to congestion on the impacted flowgates are using firm or non-firm transmission. Reliability coordinators are not required to implement TLRs in order. The TLR levels are described below.³

- **TLR Level 0 – TLR concluded:** A TLR Level 0 is initiated when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) violations are mitigated and the system is returned to a reliable state. Upon initiation of a TLR Level 0, transactions with the highest transmission priorities are reestablished first when possible. The purpose of a TLR Level 0 is to inform all affected parties that the TLR has been concluded.
- **TLR Level 1 – Potential SOL or IROL Violations:** A TLR Level 1 is initiated when the transmission system is still in a secure state but a reliability coordinator anticipates a transmission or generation contingency or other operating problem that could lead to a potential violation. No actions are required during a TLR Level 1. The purpose of a TLR Level 1 is to inform other reliability coordinators of a potential SOL or IROL.

- **TLR Level 2 – Hold transfers at present level to prevent SOL or IROL Violations:** A TLR Level 2 is initiated when the transmission system is still in a secure state but one or more transmission facilities are expected to approach, are approaching or have reached their SOL or IROL. The purpose of a TLR Level 2 is to prevent additional transactions that have an adverse affect on the identified transmission facility(ies) from starting.
- **TLR Level 3a – Reallocation of transmission service by curtailing interchange transactions using non-firm point-to-point transmission service to allow interchange transactions using higher priority transmission service:** A TLR Level 3a is initiated when the transmission system is secure but one or more transmission facilities are expected to approach, or are approaching their SOL or IROL, when there are transactions using non-firm point-to-point transmission service that have a greater than 5 percent effect on the facility and when there are transactions using a higher priority point-to-point transmission reservation that wish to begin. Curtailments to transactions in a TLR 3a begin on the top of the hour only. The purpose of TLR Level 3a is to curtail transactions using lower priority non-firm point-to-point transmission to allow transactions using higher priority transmission to flow.
- **TLR Level 3b – Curtail interchange transactions using non-firm transmission service arrangements to mitigate a SOL or IROL violation:** A TLR Level 3b is initiated when one or more transmission facilities is operating above their SOL or IROL; such operation is imminent and it is expected that facilities will exceed their reliability limits if corrective action is not taken; or one or more transmission facilities will exceed their SOL or IROL upon the removal from service of a generating unit or other transmission facility and transactions are flowing that are using non-firm point-to-point transmission service and have a greater than 5 percent impact on the facility. Curtailments of transactions in a TLR 3b can occur at any time within the operating hour. The purpose of a TLR Level 3b is to curtail transactions using non-firm point-to-point transmission service which impact the constraint by greater than 5 percent in order to mitigate a SOL or IROL.

³ Additional details regarding the TLR procedure can be found in NERC, "Standard IRO-006-4 – Reliability Coordination – Transmission Loading Relief" (October 23, 2007) (Accessed January 16, 2013) <<http://www.nerc.com/files/IRO-006-4.pdf>> (KB).

- **TLR Level 4 – Reconfigure Transmission:** A TLR Level 4 is initiated when one or more transmission facilities are above their SOL or IROL limits or such operation is imminent and it is expected that facilities will exceed their reliability limits if corrective action is not taken. Upon issuance of a TLR Level 4, all transactions using non-firm point-to-point transmission service, in the current and next hour, with a greater than 5 percent impact on the facility, have been curtailed under the TLR 3b. The purpose of a TLR Level 4 is to request that the affected transmission operators reconfigure transmission on their system, or arrange for reconfiguration on other transmission systems, to mitigate the constraint if a SOL or IROL violation is imminent or occurring.
- **TLR Level 5a – Reallocation of transmission service by curtailing interchange transactions using firm point-to-point transmission service on a pro rata basis to allow additional interchange transactions using firm point-to-point transmission service:** A TLR Level 5a is initiated when one or more transmission facilities are at their SOL or IROL; all interchange transactions using non-firm point-to-point transmission service that affect the constraint by greater than 5 percent have been curtailed; no additional effective transmission configuration is available; and a transmission provider has been requested to begin an interchange transaction using previously arranged firm point-to-point transmission service. Curtailments to transactions in a TLR 5a begin on the top of the hour only. The purpose of a TLR Level 5a is to curtail existing interchange transactions, which are using firm point-to-point transmission service, on a pro rata basis to allow for the newly requested interchange transaction, also using firm point-to-point transmission service, to flow.
- **TLR Level 5b – Curtail transactions using firm point-to-point transmission service to mitigate an SOL or IROL violation:** A TLR Level 5b is initiated when one or more transmission facilities are operating above their SOL or IROL or such operation is imminent; one or more transmission facilities will exceed their SOL or IROL upon removal of a generating unit or another transmission facility; all interchange transactions using non-firm point-to-point transmission service that affect the constraint by greater than 5 percent have been curtailed; and no additional effective transmission configuration is available. Unlike a TLR 5a, curtailments to transactions in a TLR 5b can occur at any time within the operating hour. The purpose of a TLR Level 5b is to curtail transactions using firm point-to-point transmission service to mitigate a SOL or IROL.
- **TLR Level 6 – Emergency Procedures:** A TLR Level 6 is initiated when all interchange transactions using both non-firm and firm point-to-point transmission have been curtailed and one or more transmission facilities are above their SOL or IROL, or will exceed their SOL or IROL upon removal of a generating unit or other transmission facility. The purpose of a TLR Level 6 is to instruct balancing authorities and transmission providers to redispatch generation, reconfigure transmission or reduce load to mitigate the critical condition.

Table E-1 below shows the number of TLRs, by level, issued by reliability coordinators in the Eastern Interconnection since 2004.

Table E-1 TLRs by level and reliability coordinator: 2004 through 2013

Day-Ahead Market

For Day-Ahead Market scheduling, EES serves only as an interface to the eMKT application. Day-Ahead Market transactions are evaluated in the Day-Ahead Market, and the results sent to EES. No checkout is performed on Day-Ahead Market schedules as they are considered financially binding transactions and not physical schedules.

Submitting Day-Ahead Market Schedules

Market participants can submit Day-Ahead Market schedules to the eMKT application through EES. These schedules do not require a NERC Tag, as they are not

physical schedules for actual flow. Day-Ahead Market schedules require an OASIS number to be associated upon submission.⁴ The path is identified on the OASIS reservation. In addition to the selection of OASIS and pricing points, the market participant must enter their energy profile. "Fixed" act as a price taker, "dispatchable" set a floor or ceiling price criteria for acceptance and "up-to" set the maximum amount of congestion the market participant is willing to pay.

NYISO Issues

If interface prices were defined in a comparable manner by PJM and the NYISO, if identical rules governed external transactions in PJM and the NYISO, if time lags were not built into the rules governing such transactions and if no risks were associated with such transactions, then prices at the interfaces would be expected to be very close and the level of transactions would be expected to be related to any price differentials. The fact that none of these conditions exists is important in explaining the observed relationship between interface prices and inter-ISO power flows, and those price differentials.⁵

There are institutional differences between PJM and the NYISO markets that are relevant to observed differences in border prices.⁶ The NYISO requires hourly bids or offer prices for each export or import transaction and clears its market for each hour based on hourly bids.⁷ Import transactions to the NYISO are treated by the NYISO as generator bids at the NYISO/PJM proxy bus. Export transactions are treated by the NYISO as price-capped load offers. Competing bids and offers are evaluated along with other NYISO resources and a proxy bus price is derived. Bidders are notified of the outcome. This process is repeated, with new bids and offers each hour. A significant lag exists between the time when offers and bids are submitted to the NYISO and the time when participants are notified that they have cleared. The lag is a result of the Real-Time Commitment (RTC) system

and the fact that transactions can only be scheduled at the beginning of the hour.

As a result of the NYISO's RTC timing, market participants must submit bids or offers by no later than 75 minutes before the operating hour. The bid or offer includes the MW volume desired and, for imports into NYISO, the asking price or, for exports out of the NYISO, the price the participants are willing to pay. The required lead time means that participants make price and MW bids or offers based on expected prices. Transactions are accepted only for a single hour.

Under PJM operating practices, in the Real-Time Market, participants must make a request to import or export power at one of PJM's interfaces at least 20 minutes before the desired start which can be any quarter hour.⁸ The duration of the requested transaction can vary from 45 minutes to an unlimited amount of time. Generally, PJM market participants provide only the MW, the duration and the direction of the real-time transaction. While bid prices for transactions are allowed in PJM, less than 1 percent of all transactions submit an associated price. Transactions are accepted, with virtually no lag, in order of submission, based on whether PJM has the capability to import or export the requested MW. If transactions do not submit a price, the transactions are priced at the real-time price for their scheduled imports or exports. As in the NYISO, the required lead time means that participants must make offers to buy or sell MW based on expected prices, but the required lead time is substantially shorter in the PJM market.

The NYISO rules provide that the RTC results should be available 45 minutes before the operating hour. Winning bidders then have 25 minutes from the time when the RTC results indicate that their transaction will flow to meet PJM's 20-minute notice requirement. To get a transaction cleared with PJM, the market participant must have a valid NERC Tag, an OASIS reservation and a PJM ramp reservation. Each of these requirements takes time to process.

The length of required lead times in both markets may be a contributor to the observed relationship between price differentials and flows. Market conditions can change

⁴ On September 17, 2010, up-to congestion transactions no longer required a willing to pay congestion transmission reservation. Additionally, effective May 15, 2012, up-to congestion transactions were required to be submitted for the PJM Day-Ahead Market evaluation in the eMarket application, and are no longer accepted through the EES application. Additional details can be found under the "Up-to Congestion" heading in Section 9: Interchange Transactions of this report.

⁸ See PJM, "Regional Transmission and Energy Scheduling Practices," Version 20 (December 5, 2013). (Accessed February 25, 2014) <<http://www.pjm.com/~media/etools/oasis/regional-practices-clean-doc.ashx>> (448 KB).

significantly in a relatively short time. The resulting uncertainty could weaken the observed relationship between contemporaneous interface prices and flows.

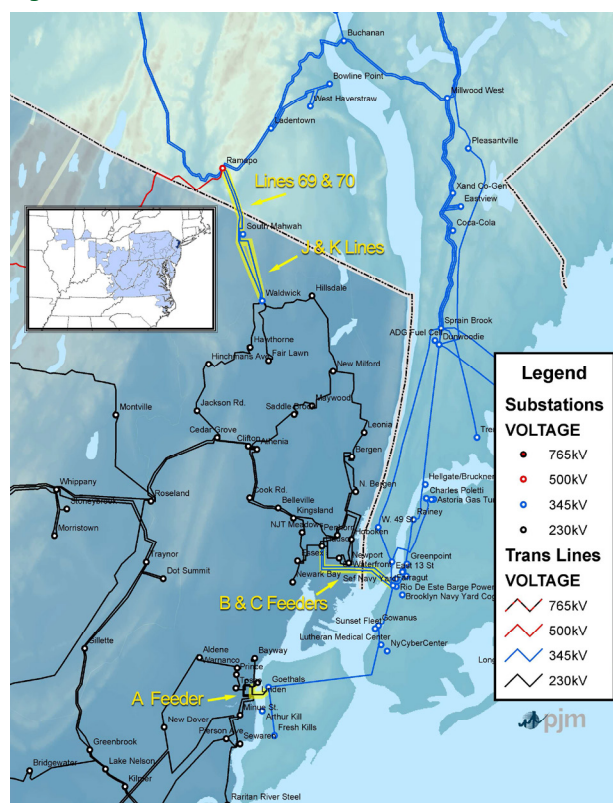

Consolidated Edison Company (Con Edison) and Public Service Electric and Gas Company (PSE&G) Wheeling Contracts

To help meet the demand for power in New York City, Con Edison uses electricity generated in upstate New York and wheeled through New York and New Jersey. A common path is through Westchester County using lines controlled by the NYISO. Another path is through northern New Jersey using lines controlled by PJM. This wheeled power creates loop flow across the PJM system. The Con Edison/PSE&G contracts governing the New Jersey path evolved during the 1970s and were the subject of a Con Edison complaint to the FERC in 2001. In May 2005, the FERC issued an order setting out a protocol developed by the two companies, PJM and the NYISO.⁹ In July 2005, the protocol was implemented. Con Edison filed a protest with the FERC regarding the delivery performance in January 2006. In August 2007, the FERC denied a rehearing request on Con Edison's complaints regarding protocol performance and refunds. PJM continued to operate under the terms of the protocol through 2012.

These contracts provided for the delivery of up to 1,000 MW of power from Con Edison's Ramapo Substation in Rockland County, New York, to PSE&G at its Waldwick Switching Substation in Bergen County, New Jersey. PSE&G wheels the power across its system and delivers it to Con Edison across lines connecting directly into New York City (Figure E-1). Two separate contracts covered these wheeling arrangements. A 1975 agreement covers delivery of up to 400 MW through Ramapo (New York) to PSE&G's Waldwick Switching Station (New Jersey) via the J line and ultimately from the Linden Switching Station (New Jersey) to the Goethals Substation (New York) and from the Hudson Generating Station (New Jersey) to the Farragut Switching Station (New York), via the A and B feeders, respectively. A 1978 agreement covered delivery of up to an additional 600 MW through

Ramapo to Waldwick then to Fair Lawn, via the K line, and ultimately through a second Hudson-to-Farragut line, the C feeder.

Figure E-1 Con Edison and PSE&G wheel

After years of litigation concerning whether or on what terms Con Edison's protocol would be renewed, PJM filed on February 23, 2009, a settlement on behalf of the parties to resolve remaining issues with these contracts and their proposed rollover of the agreements under the PJM OATT.¹⁰ By order issued September 16, 2010, the Commission approved this settlement,¹¹ which extends Con Edison's special protocol indefinitely. The Commission approved transmission service agreements provide for Con Edison to take firm point-to-point service going forward under the PJM OATT. The Commission rejected objections raised first by NRG and FERC trial staff, and later by the MMU, that this arrangement is discriminatory and inconsistent with the

9 111 FERC ¶ 61,228 (2005).

10 See Docket Nos. ER08-858-000, et al. The settling parties are the New York Independent System Operator, Inc. (NYISO), Con Ed, PSE&G, PSE&G Energy Resources & Trading LLC and the New Jersey Board of Public Utilities.

11 132 FERC ¶ 61,221 (2010).

Commission's open access transmission policy.¹² The settlement defined Con Edison's cost responsibility for upgrades included in the PJM Regional Transmission Expansion Plan. Con Edison is responsible for required transmission enhancements, and must pay the associated charges during the term of its service, and any subsequent roll over of the service.¹³ Con Edison's rolled over service became effective on May 1, 2012. At that time, Con Edison became responsible for the entire 1,000 MW of transmission service and all associated charges and credits. In 2013, Con Edison's congestion credits were less than its day-ahead congestion charges (credits had also been less than charges in 2012).

¹³ The terms of the settlement state that Con Edison shall have no liability for transmission enhancement charges prior to the commencement of, or after the termination of, the term of the rolled over service.

Ancillary Service Markets

This appendix covers five areas related to Ancillary Service Markets: area control error, Control Performance Standard 1 and Balancing Authority ACE Limit, Disturbance Control Standard (DCS), Regulation Market design changes, and the Synchronized Reserve Market clearing process.

Area Control Error (ACE)

Area control error (ACE) is a real-time measure of the instantaneous MW imbalance between load plus net interchange and generation within PJM.¹ PJM dispatchers seek to ensure grid reliability by balancing ACE. The metrics for success in balancing ACE are control performance standard 1 (CPS1) and balancing authority ACE limit (BAAL) performance. These measurements are mandated by the North American Electric Reliability Council (NERC).²

In the absence of a severe grid disturbance, the primary tool used by dispatchers to control ACE is regulation. Regulation is defined as a variable amount of energy under automatic control which is independent of economic cost signal and is obtainable within five minutes. Regulation contributes to maintaining the balance between load and generation by moving the output of selected generators up and down via an automatic generation control (AGC) signal.³

Control Performance Standard 1 (CPS1) and Balancing Authority ACE Limit (BAAL)

Control Performance Standard 1 (CPS1) and Balancing Authority ACE Limit (BAAL) are the NERC metrics for the effectiveness of ACE control. The goal of ACE control is to maintain interconnection frequency within a predefined frequency profile under all conditions (normal and abnormal). CPS1/BAAL are performance

standards used to measure and report how well PJM accomplishes ACE and frequency balance. Frequency (as it applies to the electric power grid) is the rate at which alternating current cycles between minimum and maximum. Usually this is 60 Hz (a Hz is one cycle per second). PJM measures the instantaneous frequency every two seconds. Frequency changes when there is an imbalance between generation and load causing a mismatch between actual and scheduled tie-line flow. PJM dispatchers seek to minimize this deviation. If the mismatch persists then over time a time error can accumulate.

CPS1 is a statistical measure of ACE variability and its relationship to frequency error. It is measured each minute and averaged over a year. CPS1 is defined as “the average of the clock-minute averages of a Balancing Area’s ACE divided by minus 10 B (where B is Balancing Area frequency bias) times the corresponding clock-minute averages of the Interconnection’s frequency error must be less than a specific limit. This limit, ‘e’, is a constant derived from a targeted frequency bound (limit) that is reviewed and set, as necessary, by NERC.”⁴

Frequency bias is a physical attribute of a control area. It is defined as the natural response in MW of that control area (at estimated yearly peak demand) to a change in frequency of 0.1 Hz.⁵ NERC requires each balancing authority to review and report its frequency bias setting by January 1 each year.

NERC Standard BAL-001-0.1a requires PJM “[t]o maintain Interconnection steady-state frequency within defined limits by balancing real power demand and supply in real-time.”⁶ Meeting the CPS1 standard requires PJM dispatchers to maintain ACE within a fixed range (currently set to +/-297.8 MW) around zero. The defined fixed range (+297.8/-297.8) is called L_{10} . Compliance with the CPS1 standard requires that 90 percent of 10-minute periods have an average ACE value within the L_{10} range. The L_{10} was last changed on June 1, 2013, as a result of the EKPC integration. The pre EKPC integration value was 294.14 MW.

¹ The PJM Manuals define ACE and the methodology for calculating it: “Area Control Error is a measure of the imbalance between sources of power and uses of power within the PJM RTO. This imbalance is calculated indirectly as the difference between scheduled and actual net interchange, plus the frequency bias contribution to yield ACE in megawatts. Two additional terms may be included in ACE under certain conditions—the time error bias term and PJM dispatcher adjustment term (manual add). These provide for automatic inadvertent interchange payback and error compensation, respectively.” “PJM Manual 12: Balancing Operations,” Revision 30 (December 1, 2013), para. 3.1.1, “PJM Area Control Error” p. 12.

⁶ NERC Standard BAL-001-0.1a <<http://www.pjm.com/~media/training/core-curriculum/ip-nerc-stand/nerc-reliability-refresher.ashx>>, pg. 5.

CPS1 is calculated as $CPS1 = (2 - CF) \times 100\%$. It can be seen from this equation that if the yearly one-minute average deviations (CF) were zero the CPS1 score would be a perfect 200 percent. The frequency related compliance factor (CF) is a ratio of the accumulating clock-minute compliance parameters for the most recent twelve consecutive calendar months, divided by the square of the target frequency bound (ϵ_{1i}). The ϵ_{1i} value for the Eastern Interconnection during 2013 is set to 0.018 Hz.

CPS1 is intended to provide a frequency-sensitive evaluation of how well PJM meets its demand requirements with its supply resources. The maximum CPS1 score is 200 percent. This is achieved when either the frequency error is zero or the ACE is zero. The minimum passing score is 100 percent monthly.

Since August 1, 2006, PJM has participated in the NERC Standard Proof-Of-Concept Field Test for establishing a new metric, Balancing Authority ACE Limit (BAAL), which is intended to replace the old CPS2. BAAL is a measure of the relationship between frequency and ACE such that both must remain within the blue area in Figure F-2. The $BAAL_{High}$ and $BAAL_{Low}$ limits are curves which are functions of measured frequency and scheduled frequency.

PJM counts the total number of minutes that ACE complies with the BAAL limits (high and low) and divides it by the total number of minutes for a month, with a passing level for this goal being set at 99.0 percent for each month. BAAL high and low limits are defined dynamically.⁷

When actual frequency is less than Scheduled Frequency, $BAAL_{High}$ does not apply, and $BAAL_{Low}$ is calculated as:

$$BAAL_{Low} = -10B_i \times FTL_{Low} - F_s \times (FTL_{Low} - F_s)(FA - F_s)$$

When actual frequency is greater than Scheduled Frequency, $BAAL_{Low}$ does not apply and the $BAAL_{High}$ is calculated as:

$$BAAL_{High} = -10B_i \times FTL_{High} - F_s \times (FTL_{High} - F_s)(FA - F_s)$$

$BAAL_{Low}$ is the Low Balancing Authority ACE Limit (MW), $BAAL_{High}$ is the High Balancing Authority ACE Limit (MW), 10 is a constant to convert the Frequency

Bias Setting from MW/0.1 Hz to MW/Hz, B_i is the Frequency Bias Setting for a Balancing Authority (expressed as MW/0.1 Hz), F_A is the measured frequency in Hz, F_s is the scheduled frequency in Hz, FTL_{Low} is the Low Frequency Trigger Limit (calculated as $F_s - 3\epsilon_{1I}$ Hz), and FTL_{High} is the High Frequency Trigger Limit (calculated as $F_s + 3\epsilon_{1I}$ Hz). The constant ϵ_{1I} is derived from a targeted frequency bound for each Interconnection as follows: Eastern Interconnection ϵ_{1I} is 0.018 Hz, Western Interconnection ϵ_{1I} is 0.0228 Hz, ERCOT Interconnection ϵ_{1I} is 0.030 Hz, and Quebec Interconnection ϵ_{1I} is 0.021 Hz.

Figure F-1 shows the relationship of measured frequency to allowable ACE deviation when measured frequency is less than scheduled frequency (defined by the $BAAL_{Low}$ equation, scheduled frequency = 60 Hz and negative ACE only). As the measured frequency approaches the scheduled frequency (60 Hz), the allowable ACE increases in absolute value.

Figure F-1 Allowable ACE as a function of measured frequency

As an example consider a single 2-second measurement under the following scenario. The frequency bias is -1,574 MW/0.1Hz (as it is in the Eastern Interconnection), the frequency profile is calling for a scheduled frequency of 60Hz (this is normal but can be changed by PJM dispatch under certain circumstances), and the measured real-time frequency is 59.92. Under this scenario, applying the formula for $BAAL_{Low}$ shows that ACE needs to be greater than -573.723 MW in order for this one measurement to be within acceptable BAAL limits. A complete scenario is provided by adding the ACE deviation for measured

⁷ NERC BAL-001-2, Real Power Balancing Control Performance."

frequency greater than scheduled frequency $BAAL_{High}$ (Figure F-2).

Figure F-2 Example set of BAAL measurements. Set of measurements is every two seconds for four minutes.

PJM's CPS/BAAL Performance

Figure F-3 shows PJM's CPS1 and BAAL performance was acceptable (CPS1 minimum passing monthly value is 100 percent and BAAL passing monthly value is 99.0 percent) throughout 2013.

Figure F-3 PJM CPS1/BAAL performance: 2013

PJM's DCS Performance

The NERC disturbance control standard (DCS) measures how well ACE recovers from a disturbance.⁸ A disturbance is defined by NERC as any ACE deviation caused by sudden loss of generation greater than, or equal to, 80 percent of PJM's most severe single contingency loss. Disturbance control is measured and must be reported to NERC quarterly as percentage of recovery (R_i) as defined below.

If ACE was positive or zero just before the disturbance then ACE must be returned to zero within fifteen minutes. Full disturbance recovery within fifteen minutes represents 100 percent performance under this measure. Less than full recovery in fifteen minutes earns a score defined as:

$$R_i = \left(\frac{MW_{loss} - \max(0, ACE_a - ACE_m)}{MW_{loss}} \right) *$$

If ACE was negative just before the disturbance then ACE must be returned to its pre-disturbance value. Full disturbance recovery within fifteen minutes represents 100 percent performance under this measure. Less than full recovery in fifteen minutes earns a score as per:

$$R_i = \left(\frac{MW_{loss} - \max(0, -ACE_m)}{MW_{loss}} \right) * 100\%$$

Where MW_{loss} is the MW size of the disturbance from the beginning of the loss, ACE_a is the pre-disturbance ACE, ACE_m is the maximum algebraic value of the ACE measured within fifteen minutes following the disturbance.

PJM experienced ten DCS events in 2013. PJM experienced 16 DCS events in 2012. PJM's DCS performance in 2012 and 2013 was 100 percent. (Figure F-4.)

Although PJM recovered from all ten DCS events by declaring a spinning event, not all spinning events are caused by DCS events. DCS events are "sudden unanticipated losses of supply-side resources."⁹ Several significant spinning events in 2013, most notably the 68 minute event of September 10 and the 33 minute

⁸ For more information on the NERC DCS, see "Standard BAL-002-0 – Disturbance Control Performance" (April 1, 2005) <www.nerc.com/files/BAL-002-0.pdf> (61 KB).

⁹ Standard BAL-002-0 – Disturbance Control Performance" (April 1, 2005) <www.nerc.com/files/BAL-002-0.pdf> (61 KB) para. 1.4, pag. 4.

event of October 28, were caused by low ACE and were therefore not reportable as DCS events.

Figure F-4 DCS event count and PJM performance (By month): 2012-2013

Regulation Market Design Changes

On October 20, 2011, FERC issued Order No. 755 directing PJM and other RTOs/ISOs to modify their regulation market rules to include fast as well as traditional slow response regulation resources.”¹⁰

A rationale for the new market design was the assumption that new, fast response technologies could be used, in combination with slow resources, to reduce the total amount of resources needed to meet regulation requirements and thereby reduce the cost of regulation. Order No. 755 required that the fast and slow resources be purchased in a single market, with compensation for both capacity (MW) and miles (Δ MW).¹¹ Regulation miles are calculated as the sum of the absolute value of a given regulation resource’s movement (up and down) in response to a regulation signal.

To implement the new fast regulation PJM developed a fast regulation signal (RegD) that responds geometrically faster to changes in ACE. This signal is in addition to the traditional slow regulation signal (RegA). Resources are free to choose which signal they will follow. A PJM commissioned study by KEMA indicated that including

a combination of RegA and RegD following resources in the Regulation Market would allow PJM to reduce its regulation requirement but still maintain CPS1 scores close to the historical average (significantly above the passing score of 100 percent).¹²

According to the study, the smaller the proportion of fast regulation MW and the greater the proportion of slow regulation used, the more benefit there is to substituting fast regulation MW for slow regulation MW. In other words, the smaller the proportion of fast regulation used, the more slow regulation each MW of fast regulation can replace. Conversely, as the proportion of fast resources increases, the benefit of substituting fast capability for slow capability in meeting a specific regulation performance target decreases. This relationship is the marginal benefit factor, or rate of substitution, between fast and slow resources. The marginal benefit factor decreases as the amount of fast resources increases. Eventually, the addition of another MW of fast capability actually requires adding rather than replacing MW of slow capability to maintain a regulation performance target. At this point the rate of substitution is negative (less than zero) and the addition of fast resources makes it harder to maintain a regulation performance target.¹³ In other words, it is possible for PJM to achieve a passing CPS1 score (100 percent) entirely with resources following the RegA signal as PJM has done since its inception, but PJM cannot achieve a passing CPS1 score using only resources following the RegD signal.

PJM monitors compliance using the current regulation signals CRegA and CRegD. The CRegA signal tracks compliance with the RegA signal and the CRegD signal tracks compliance with the RegD signal. The current regulation signals CRegA and CRegD are calculated every two seconds as the sum of the response of a regulation resource (a resource here can mean a fleet or the entire set of RegA or RegD resources). The current regulation signals CRegA and CRegD are a measure of real time regulation feedback sent to PJM to determine if and to what degree the regulation signals RegA and RegD are being followed.¹⁴ Regulation continues to be

¹⁰ Order No. 755 at P 3. FERC ordered PJM “to compensate frequency regulation resources based on the actual service provided, including a capacity payment that includes the marginal unit’s opportunity costs and a payment for performance that reflects the quantity of frequency regulation service provided by a resource when the resource is accurately following the dispatch signal.”

¹¹ Id. at PP 99, 131 & 177.

¹² See KEMA, “KERMIT Study Report,” (December 13, 2011).

¹³ PJM calculates a marginal benefit factor using a function that is arbitrarily defined to have zero as its lower bound. The practical impact of this incorrect functional form is likely to be negligible in the near term because substantially more RegD resources would have to be added to result in a negative marginal benefit factor but the function should be corrected. See PJM, “Manual 11: Energy & Ancillary Services Markets Operations,” Revision 66 (March 7, 2014), p. 56.

¹⁴ See PJM, “Manual 12: Balancing Operations,” Revision 30 (December 1, 2013), p. 43.

provided and measured primarily at the fleet level. That is, fleet owners decide how to allocate the RegA or RegD signals among individual units in their fleet and PJM tracks compliance with the RegA and RegD signals only on a fleet basis.¹⁵ Figure F-5 shows a screenshot of a typical 10-minute time period of PJM's RegA signal and CRegA signal for all RegA resources. Figure F-6 shows a screenshot of typical 10-minute time period of PJM's RegD signal and CRegD signal for all RegD resources.

Figure F-5 PJM RegA signal and CReg compliance signal. Screenshot of typical 10-minute time period

Figure F-6 PJM RegD signal and CRegD compliance signal. Screenshot of typical 10-minute time period

Regulation signals are designed for the purpose of moderating ACE, accounting for the characteristics of the expected response from the resources following the signal. The RegD signal is designed to contribute to the moderation of ACE given the attributes of fast regulation resources. The RegA signal is designed to contribute to the moderation of ACE given the attributes of traditional sources of regulation. Even a very fast regulating unit will need to have some capability to provide sustained

MWh to help with ACE correction, and even a unit with a large MW capability must be able to react with some speed to help with ACE correction. The relationship between the two types of regulating resources is under constant review and the relationship between the two (expressed in the marginal benefit factor) is subject to change.

- Regulation Offers.** All owners of generating and demand resources qualified to provide regulation may offer their regulation capability price in \$/MW at cost plus up to \$12 adder daily into the Regulation Market using the PJM market user interface. There is no must offer requirement for resources qualified to provide regulation. Users must also enter the signal type they want to follow (RegA or RegD), their regulation capability in MW, as well as cost validation parameters including fuel cost, heat rate at economic maximum, heat rate at regulation minimum, and the VOM rate. Regulating units may also self-schedule. Self-scheduled units have zero lost opportunity cost (LOC) and are the first to be assigned. Owners may also enter price based offers up to a maximum of \$100/MW. Demand resources are eligible to offer regulation and did so for the first time in November 2011. Demand resources have an LOC of zero. Under current PJM rules, no more than 25 percent of the total regulation requirement may be supplied by demand resources.¹⁶ Total regulation offers are the sum of all regulation capable units that offer regulation into the market for the day and that are not out of service or fully committed to provide energy. Owners of units that have entered offers into the PJM market user interface system have the ability to set unit status to "unavailable" for regulation for the day, or for a specific hour or set of hours. They also have the ability to change the amount of regulation MW offered in each hour. Unit owners do not have the ability to change their regulation offer price during a day. All regulation offers that are not set to unavailable for the day are summed to calculate the total daily regulation offered, a figure that changes each hour.
- Regulation Offered and Eligible.** Sixty minutes before the market hour, PJM runs the Ancillary Services Optimizer software (ASO) to determine

¹⁵ See PJM, "Manual 11: Energy & Ancillary Services Markets Operations," Revision 66 (March 7, 2014), pp. 44 and 59.

¹⁶ See PJM, "Manual 11: Energy & Ancillary Services Markets Operations," Revision 66 (March 7, 2014), p. 49.

the amount of Tier 2 synchronized reserve/non-synchronized reserve required, develop regulation and synchronized reserve supply curves, and assign regulation, synchronized reserve, and non-synchronized reserve to specific units. All regulation resource units which have made offers in the daily Regulation Market are evaluated by ASO for regulation. ASO excludes units according to the following ordered criteria: daily or hourly unavailable status; units for which the economic minimum is set equal to economic maximum (unless the unit is a hydroelectric unit or has self-scheduled regulation); units assigned synchronized reserve; units for which regulation minimum is set equal to regulation maximum (unless the unit is a hydroelectric unit or has self-scheduled regulation); units that are offline (except combustion turbine units).¹⁷

Even after ASO has run and selected units for regulation, PJM dispatchers can dispatch units uneconomically for several reasons including: to control transmission constraints; to avoid over-generation during periods of minimum generation alert; to remove a unit temporarily unable to regulate; or to remove a unit with a malfunctioning data link.

For each offered and eligible unit in the regulation supply, the regulation total capability offer price is calculated using the sum of the unit's regulation cost-based offer (divided by the marginal benefit factor of the resource type and the historic performance score of the resource) plus the opportunity cost based on the forecast LMP, unit economic minimum and economic maximum, regulation minimum and regulation maximum, startup costs and relevant offer schedule. Based on this result, ASO determines if the period has three or fewer pivotal suppliers. If it does, all owners who are pivotal have their offers limited to the lesser of their cost or price offer. ASO uses price-based offers for those operators not offer capped and re-solves. Unit assignments based on this solution are final. The final clearing price is not determined at the time of unit assignment.

The Regulation, Synchronized Reserve, and Non-Synchronized Reserve Markets are cleared, prior to the hour, and supplementally within the hour, on a real time basis. The Regulation, Synchronized Reserve,

and Non-Synchronized Reserve Markets are cleared and priced interactively with the Energy Market and secondary reserve requirements to minimize the cost of the combined products subject to reactive limits, resource constraints, unscheduled power flows, inter area transfer limits, resource distribution factors, self-scheduled resources, limited fuel resources, bilateral transactions, hydrological constraints, generation requirements, reserve requirements and prior to the hour assignments for regulation and reserves. The final clearing prices are calculated at five-minute intervals based on the real time prices and LMPs of energy. These five-minute prices are averaged to arrive at the final hourly clearing price. This price is sent to Settlements and used as the basis for credits and charges.

- **Cleared Regulation.** Regulation actually assigned by ASO is cleared regulation. The capability and performance prices are calculated every five minutes by the Locational Pricing Calculator (LPC) with the final hourly clearing price averaged from the five minute prices. In real time, resources that have been assigned an ancillary service are expected to provide that ancillary service for the designated hour.
- **Settled Regulation.** Resources or fleets of resources providing regulation are compensated by RMCP (Regulation Market Clearing Price) credits and opportunity cost credits. RMCP credits are the sum of RMCCP (Regulation Market Capability Clearing Price) credits and RMPCP (Regulation Market Performance Clearing Price) credits. RMCCP credits are calculated as MW of regulation capability times the performance score times RMCCP. For RegA resources, RMPCP credits are calculated as MW of regulation capability times performance score times RMPCP. For RegD resources, RMPCP credits are calculated as MW of regulation capability times performance score times RegD to RegA mileage ratio times RMPCP. When calculating RMCCP and RMPCP credits, the MW of regulation capability are defined as the actual MW provided (as opposed to cleared MW or effective MW). A regulation resource receives opportunity cost credits only if its RMCP credits are less than its offer plus opportunity cost (including lost opportunity cost during shoulder hours). The cost per actual MW of settled regulation can be higher than the regulation clearing price because actual MW and cleared MW may differ

¹⁷ See PJM, "Manual 11: Energy & Ancillary Services Markets Operations," Revision 66 (March 7, 2014), pp. 26-27.

and RMCP credits may not completely cover lost opportunity costs.

Synchronized Reserve Market Clearing

PJM's market clearing engines consider resources capable of providing Tier 2 synchronized reserve to be either flexible or inflexible. Inflexible units are scheduled by the hourly market solution sixty minutes before the operating hour, are committed to provide synchronized reserve for the entire hour, and are paid the higher of the SRMCP or their offer price plus LOC (demand response resources are paid SRMCP). Flexible units are identified every time the market solution runs (hour ahead, intermediate term, and short term) and can be assigned to either synchronized reserve or to energy depending on the economic solution.

In the Mid-Atlantic Dominion Subzone, the market for Tier 2 synchronized reserve is cleared in four steps.

One hour before the market hour, ASO estimates the sum of the available Tier 1 synchronized reserve within the MAD Subzone and the available transfer capacity from outside the MAD Subzone. ASO subtracts this estimate from the MAD Subzone synchronized reserve requirement to determine the amount of MAD Tier 2 synchronized reserve needed to satisfy the requirement. If the synchronized reserve requirement is not filled from available Tier 1 then self-scheduled Tier 2 synchronized reserve is allocated. If the required synchronized reserve is still not satisfied, ASO generates a solution for ISO scheduled Tier 2 synchronized reserve from resources with synchronized reserve offers that are available. Finally, ASO logs Tier 2 synchronized reserve inflexible resources, commits these resources to provide Tier 2 synchronized reserve, and notifies these resources through eMKT. Tier 2 synchronized reserve flexible resources are changed throughout the hour by both the intermediate term and short term market clearing software.

Half an hour before the market hour, the intermediate term solution (IT SCED) performs the same functions as ASO up to the point of logging and committing individual resources, taking into account the amount of inflexible resources already committed by ASO. IT SCED, however, does not consider DSR in its solution. After IT

SCED produces its solution, a PJM operator reviews the solution, calls the inflexible resources to commit them to provide Tier 2 synchronized reserve, and logs each resource separately. As with ASO, the amount of Tier 2 synchronized reserve provided by flexible resources is not logged and is not carried through to later steps in the clearing process.

Third, 15 minutes before each five-minute period in the market hour, real time solution (RT SCED) estimates the amount of needed Tier 2 synchronized reserve, taking into account the amount of inflexible resources already committed by ASO and IT SCED. RT SCED considers only flexible resources due to the notification-time requirements of inflexible resources. Once RT SCED generates its solution, RT SCED commits the resources from its solution and logs these resources.

Fourth, every five minutes within the market hour, LPC calculates market clearing prices by incorporating resource offers and LOC based on real-time LMP and marginal cost. LPC computes the price of one additional MW of Tier 2 synchronized based on these factors and the committed resources and uses this price as the within-hour five-minute clearing price. For the hour, the Synchronized Reserve Market Clearing Price is the simple average of the 12 five-minute clearing prices. When there is a simultaneous shortage of primary reserve and synchronized reserves the real-time prices for synchronized reserve will be the sum of the primary reserve and synchronized reserve penalty factors.¹⁸

Whereas the hourly price is the average of the five-minute prices within the hour, the hourly cost (per MW) is the sum of credits for cleared and self-scheduled synchronized reserve and credits for after market lost opportunity cost divided by the total MW of synchronized reserve cleared and self-scheduled. PJM guarantees resources to be made whole to their offer plus opportunity costs.

¹⁸ See PJM, "Manual 11: Energy & Ancillary Services Market Operations," Revision 65 (January 21, 2014), p. 72.

Congestion and Marginal Losses

The locational marginal price (LMP) is the incremental price of energy at a bus. The LMP at a bus is made up of three components: the system marginal price or energy component (SMP), the marginal loss component of LMP (MLMP), and the congestion component of LMP (CLMP).¹

SMP, MLMP and CLMP are products of the least cost, security constrained dispatch of system resources to meet system load.² SMP is the incremental cost of energy, given the current dispatch and given the choice of reference bus, or LMP net of losses and congestion. Losses refer to energy lost to physical resistance in the transmission network as power is moved from generation to load. Total losses refer to the total system-wide transmission losses as a result of moving power from injections to withdrawals on the system. Total system-wide transmission losses for 2013 were 17,389 GWh, a 2.5 percent increase compared to 2012. Marginal losses are the incremental change in system losses caused by changes in load and generation. Congestion occurs when available, least-cost energy cannot be delivered to all load because transmission facilities are not adequate to deliver that energy and higher cost units in the constrained area must be dispatched to meet that load.³ The result is that the price of energy in the constrained area is higher than in the unconstrained area.

Congestion is neither good nor bad, but is a direct measure of the extent to which there are multiple marginal generating units dispatched to serve load as a result of transmission constraints.

The energy, marginal losses and congestion metrics must be interpreted carefully. The term total congestion refers to what is actually net congestion, which is calculated as

net implicit congestion costs plus net explicit congestion costs plus net inadvertent congestion charges. The net implicit congestion costs are the load congestion payments less generation congestion credits. This section refers to total energy costs and total marginal loss costs in the same way. As with congestion, total energy costs are more precisely termed net energy costs and total marginal loss costs are more precisely termed net marginal loss costs.

The components of LMP are the basis for calculating participant and location specific congestion and marginal losses.⁴

Congestion Costs

Zonal Congestion Costs

Day-ahead and balancing congestion costs by zone for 2013 and 2012 are presented in Table G-1 and Table G-2.⁵ While total congestion costs represent the overall charge or credit to a zone, the components of congestion costs measure the extent to which load or generation bear congestion costs. Load congestion payments, when positive, measure the congestion cost to load in an area. Load congestion payments, when negative, measure the congestion credit to load in an area. Negative load congestion payments result when load is on the lower priced side of a constraint or constraints. For example, congestion across the AP South interface means lower prices in western control zones and higher prices in eastern and southern control zones. Load in western control zones will benefit from lower prices and receive a congestion credit (negative load congestion payment). Load in the eastern and southern control zones will incur a congestion charge (positive load congestion payment). The reverse is true for generation congestion credits. Generation congestion credits, when positive, measure the congestion credit to generation in an area. Generation congestion credits, when negative, measure the congestion cost to generation in an area. Negative generation congestion credits result when generation is on the lower priced side of a constraint or constraints. For example, congestion across the AP South interface means lower prices in the western control zones and

1 On January 1, 2012, PJM integrated the Duke Energy Ohio/Kentucky (DEOK) Control Zone. On June 1, 2013, PJM integrated the East Kentucky Power Cooperative (EKPC) Control Zone. The metrics reported in this section treat DEOK as part of MISO for the first hour of January 2012 and as part of PJM for the second hour of January through December 2012. The metrics reported in this section treat EKPC as part of MISO for the first hour of June 2013 and as part of PJM for the second hour of June through June 2013.

2 For more information about LMP see the *Technical Reference for PJM Markets*, "Calculating Locational Marginal Price." <http://www.monitoringanalytics.com/reports/Technical_References/references.shtml>.

3 This is referred to as dispatching units out of economic merit order. Economic merit order is the order of all generator offers from lowest to highest cost. Congestion occurs when loadings on transmission facilities mean the next unit in merit order cannot be used and a higher cost unit must be used in its place. Dispatch within the constrained area follows merit order for the units available to relieve the constraint.

4 The total congestion and marginal losses were calculated as of January 28, 2014, and are subject to change, based on continued PJM billing updates.

5 The total zonal congestion numbers were calculated as of January 28, 2014 and are based on PJM billing data which is subject to change. As of January 28, 2014, the total zonal congestion related numbers here differed from the January 28, 2014 PJM totals by \$0.25 Million, a difference of .00036 percent. The difference is primarily the result of missing dfax data and rounding.

higher prices in the eastern and southern control zones. Generation in the western control zones will receive lower prices and incur a congestion charge (negative generation congestion credit). Generation in the eastern and southern control zones will receive higher prices and receive a congestion credit (positive generation congestion credit).

PJM congestion accounting nets load congestion payments against generation congestion credits by billing organization. The net congestion bill for a zone or constraint may be either positive or negative, depending on the relative size and sign of load congestion payments and generation congestion credits. When summed across a zone, the net congestion bill shows the overall congestion charge or credit for an area, not including explicit congestion. But the net congestion bill is not a good measure of whether load is paying higher prices in the form of congestion.

The ComEd Control Zone, AEP Control Zone and the AP Control Zone are examples of how a positive net congestion bill can result from very different combinations of load payments and generation credits. The ComEd Control Zone had the highest congestion charges, \$155.2 million, of any control zone in 2013. The positive congestion costs in the ComEd Control Zone were the result of negative load congestion payments offset by larger negative generation congestion credits. Thus, the lower prices in ComEd, which resulted from a lower congestion component of LMP, meant that load paid lower prices and lower congestion, and that generators received lower prices and a lower congestion component. The result was positive measured congestion costs. This result follows from the fact that total zonal load is less than total zonal generation because the zone is a net exporter. In 2013, the total ComEd zonal generation was 127,235 GWh and total zonal load was 98,548 GWh.

The AEP Control Zone had the second highest congestion charges, \$106.0 million, of any control zone in 2013. The positive congestion costs in the AEP Control Zone were the result of negative load congestion payments offset by larger negative generation congestion credits.

The AP Control Zone had the third highest congestion charges, \$92.8 million, of any control zone in 2013. The positive congestion costs in the AP Control Zone were the result of negative load congestion payments offset by larger negative generation congestion credits.

The External category is not a control zone. The External category is comprised of external pricing points (buses) associated with interfaces.⁶ The total congestion cost for the external category was \$7.2 million in 2013.

⁶ The external pricing points associated with interfaces were NYIS EXT LMP, IMO EXT LMP, NORTHW EXT LMP, OVEC EXT LMP, NIPSCO EXT LMP, MISO EXT LMP, SOUTHEXP EXT LMP, SOUTHIMPEXT LMP, NEPTUNE EXT LMP, CPLEIMP EXT LMP, DUKIMP EXT LMP, NCMPEIMPEXT LMP, LINDENVEXT LMP, LEECP 115 KV PRICEPT1, ROXBOROG230 KV PRICEPT1, WAKE4 500 KV PRICEPT1, MCGUIRE4230 KV PRICEPT1, and HUDSONTPEXT LMP.

Details of Regional and Zonal Congestion

Constraints can affect prices and congestion across multiple zones. PJM is comprised of three regions: the PJM Mid-Atlantic Region with 11 control zones (the AECO, BGE, DPL, JCPL, Met-Ed, PECO, PENELEC, Pepco, PPL, PSEG and RECO control zones); the PJM West Region with eight control zones (the AP, ATSI, ComEd, AEP, DLCO, DEOK, DAY and EKPC control zones); and the PJM South Region with one control zone (the Dominion Control Zone).⁷

Table G-3 through Table G-41 present the top 15 constraints affecting each control zone's congestion costs, including the facility type and the location of the constrained facility for both 2013 and 2012. In addition, day-ahead and real-time congestion-event hours are presented for each of the highlighted constraints. The tables present the constraints in descending order of the absolute value of total congestion costs for each zone. In addition to the top 15 constraints, these tables show the top five local constraints for the control zone, which were not in the top 15 constraints, but are located inside the respective control zone. In 2013, the RECO control zone only had one internal constraint, thus the RECO table shows the top 15 constraints and one local constraint.

For each of the constraints presented in the following tables, the zonal cost impacts are decomposed into their Day-Ahead Energy Market and balancing market components. Total congestion costs are the sum of the day-ahead and balancing congestion cost components. Total congestion costs associated with a given constraint may be positive or negative in value.

FTR Volumes

This Appendix presents the data used to create Figure 13-1 in the *2013 State of the Market Report for PJM*. Each table shows the FTR bid volume, cleared volume and net bid volume by planning period. The bid volume includes the buy, sell and self-scheduled offers. The cleared volume includes the buy, sell and self-scheduled offers that clear. The net bid volume includes all bid and self-scheduled offers, excluding sell offers. The Annual Auction volume is included in June of each planning period.

Table H-1 Annual and Monthly FTR Auction bid and cleared volume: Planning period 2003 to 2004

Auction Date	Net Bid Volume (MW)	Cleared Volume (MW)	Bid Volume (MW)

Glossary

Aggregate

Combination of buses or bus prices.

Ancillary Services

Those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Provider's Transmission System in accordance with Good Utility Practice.

Area Control Error (ACE)

Area Control Error of the PJM RTO is the actual net interchange minus the biased scheduling net interchange, including time error. It is the sum of tie-in errors and frequency errors.

Associated unit (AU)

A unit that is located at the same site as a frequently mitigated unit (FMU) and which has identical electrical and economic impacts on the transmission system as an FMU but which does not qualify for FMU status.

Auction Revenue Right (ARR)

A financial instrument entitling its holder to auction revenue from Financial Transmission Rights (FTRs) based on locational marginal price (LMP) differences across a specific path in the Annual FTR Auction.

Automatic Generation Control (AGC)

An automatic control system comprised of hardware and software. Hardware is installed on generators allowing their output to be automatically adjusted and monitored by an external signal and software is installed facilitating that output adjustment.

Average hourly LMP

An LMP calculated by averaging hourly LMP with equal hourly weights; also referred to as a simple average hourly LMP.

Avoidable cost rate (ACR)

The costs that a generation owner would not incur if the generating unit did not operate for one year, in particular the delivery year. The ACR calculation is based on the categories of cost that are specified in Section 6.8 of Attachment DD of the PJM Tariff.

Avoidable Project Investment Recovery Rate (APIR)

A component of the avoidable cost rate (ACR) calculation. Project investment is the capital reasonably required to enable a capacity resource to continue operating or improve availability during peak-hour periods during the delivery year.

Balancing energy market

Energy that is generated and financially settled during real time.

Base Residual Auction (BRA)

Reliability Pricing Model (RPM) auction held in May three years prior to the start of the delivery year. Allows for the procurement of resource commitments to satisfy the region's unforced capacity obligation and allocates the cost of those commitments among the LSEs through the Locational Reliability Charge.

Behind The Meter

Behind The Meter Generation refers to a generation unit that delivers energy to load without using the Transmission System or any distribution facilities (unless the entity that owns or leases the distribution facilities has consented to such use of the distribution facilities and such consent has been demonstrated to the satisfaction of the Office of the Interconnection); provided, however, that Behind The Meter Generation does not include (i) at any time, any portion of such generating unit's capacity that is designated as a Generation Capacity Resource; or (ii) in an hour, any portion of the output of such generating unit[s] that is sold to another entity for consumption at another electrical location or into the PJM Interchange Energy Market. (OATT 1.3B)

Bilateral Agreement

An agreement between two parties for the sale and delivery of a service.

Black Start Unit

A generating unit with the ability to go from a shutdown condition to an operating condition and start delivering power without any outside assistance from the transmission system or interconnection.

Bottled Generation

Economic generation that cannot be dispatched because of local operating constraints.

Burner tip fuel price

The cost of fuel delivered to the generator site equaling the fuel commodity price plus all transportation costs.

Bus

An interconnection point.

Capacity deficiency rate (CDR)

The CDR was designed to reflect the annual fixed costs of a new combustion turbine (CT) in PJM and the annual fixed costs of the associated transmission investment, including a return on investment, depreciation and fixed operation and maintenance expense, net of associated energy revenues. The CDR is used in applying penalties for capacity deficiencies. To express the CDR in terms of unforced capacity, it must be further divided by the quantity 1 minus the EFORD.

Capacity Emergency Transfer Limit (CETL)

The capability of the transmission system to support deliveries of electric energy to a given area experiencing a localized capacity emergency as determined in accordance with the PJM Manuals.

Capacity queue

A collection of Regional Transmission Expansion Planning (RTEP) capacity resource project requests received during a particular timeframe and designating an expected in-service date.

Combined Cycle (CC)

An electric generating technology in which electricity and process steam are produced from otherwise lost waste heat exiting from one or more combustion turbines. The exiting heat is routed to a conventional boiler or to a heat recovery steam generator for use by a conventional steam turbine in the production of electricity. This process increases the efficiency of the electric generating facility.

Combustion Turbine (CT)

A generating unit in which a combustion turbine engine is the prime mover for an electrical generator.

Congestion Management Process (CMP)

A process used between neighboring balancing authorities to coordinate the re-dispatch of resources to relieve transmission constraints.

Control Zone

An area within the PJM Control Area, as set forth in the PJM Open Access Transmission Tariff and the RAA. Schedule 16 of the RAA defines the distinct zones that comprise the PJM Control Area.

Decrement Bids (DEC)

An hourly bid, expressed in MWh, to purchase energy in the PJM Day-Ahead Energy Market if the Day-Ahead LMP is less than or equal to the specified bid price. This bid must specify hourly quantity, bid price and location (transmission zone, hub, aggregate or single bus).

Demand deviations

Hourly deviations in the demand category, equal to the difference between the sum of cleared decrement bids, day-ahead load, day-ahead sales, and day-ahead-exports, to the sum of real-time load, real-time sales, and real-time exports.

Demand Resource

A capacity resource with a demonstrated capability to provide a reduction in demand or otherwise control load. A Demand Resource may be an existing or planned resource.

Dispatch Rate

The control signal, expressed in dollars per MWh, calculated and transmitted continuously and dynamically to direct the output level of all generation resources dispatched by PJM in accordance with the Offer Data.

Disturbance Control Standard

A NERC-defined metric measuring the ability of a control area to return area control error (ACE) either to zero or to its predisturbance level after a disturbance such as a generator or transmission loss.

Eastern Prevailing Time (EPT)

Eastern Prevailing Time (EPT) is equivalent to Eastern Standard Time (EST) or Eastern Daylight Time (EDT) as is in effect from time to time.

Eastern Region

Defined region for purposes of allocating balancing operating reserve charges. Includes the BGE, Dominion, PENELEC, Pepco, Met-Ed, PPL, JCPL, PECO, DPL, PSEG, and RECO transmission zones.

Economic generation

Units producing energy at an offer price less than or equal to LMP.

End-use customer

Any customer purchasing electricity at retail.

Equivalent availability factor (EAF)

The proportion of hours in a year that a unit is available to generate at full capacity.

Equivalent demand forced outage rate (EFORd)

A measure of the probability that a generating unit will not be available due to forced outages or forced deratings when there is a demand on the unit to generate.

Equivalent forced outage factor (EFOF)

The proportion of hours in a year that a unit is unavailable because of forced outages.

Equivalent maintenance outage factor (EMOF)

The proportion of hours in a year that a unit is unavailable because of maintenance outages.

Equivalent planned outage factor (EPOF)

The proportion of hours in a year that a unit is unavailable because of planned outages.

External resource

A generation resource located outside metered boundaries of the PJM RTO.

Financial Transmission Right (FTR)

A financial instrument entitling the holder to receive revenues based on transmission congestion measured as hourly energy LMP differences in the PJM Day-Ahead Energy Market across a specific path.

Firm Point-to-Point Transmission Service

Transmission Service that is reserved and/or scheduled between specified Points of Receipt and Delivery.

Firm Transmission Service

Transmission service that is intended to be available at all times to the maximum extent practicable, subject to an emergency, and unanticipated failure of a facility, or other event beyond the control of the owner or operator of the facility, or the Office of the Interconnection.

Fixed Demand Bid

Bid to purchase a defined MW level of energy, regardless of LMP.

Fixed Resource Requirement (FRR)

An alternative method for a party to satisfy its obligation to provide Unforced Capacity. Allows an LSE to avoid direct participation in the RPM Auctions by meeting their fixed capacity resource requirement using internally owned capacity resources.

Flowgate

A transmission facility or group of facilities that consist of the total interface between control areas, a partial interface, or an interface within a control area.

Frequently mitigated unit (FMU)

A unit that was offer-capped for more than a defined proportion of its real-time run hours in the most recent 12-month period. FMU thresholds are 60 percent, 70 percent and 80 percent of run hours. Such units are permitted a defined adder to their cost-based offers in place of the usual 10 percent adder.

Generation Control Area (GCA) and Load Control Area (LCA)

Designations used on a NERC Tag to describe the balancing authority where the energy is generated (GCA) and the balancing authority where the load is served (LCA). Note: the terms “Control Area” in these acronyms are legacy terms for balancing authority, and are expected to be changed in the future.

Generator deviations

Hourly deviations in the generator category, equal to the difference between a unit’s cleared day-ahead generation, and a unit’s hourly, integrated real-time generation.

Generation Offers

Schedules of MW offered and the corresponding offer price.

Generation owner

A PJM member that owns or leases, with rights equivalent to ownership, facilities for generation of electric energy that are located within PJM.

Gross export volume (energy)

The sum of all export transaction volume (MWh).

Gross import volume (energy)

The sum of all import transaction volume (MWh).

Gigawatt (GW)

A unit of power equal to 1,000 megawatts.

Gigawatt-day

One GW of energy flow or capacity for one day.

Gigawatt-hour (GWh)

One GWh is a gigawatt produced or consumed for one hour.

Herfindahl-Hirschman Index (HHI)

HHI is calculated as the sum of the squares of the market share percentages of all firms in a market.

Hertz (Hz)

Electricity system frequency is measured in hertz.

Hot/Cold Weather Alerts

A Hot Weather Alert is issued to prepare personnel and facilities for extreme hot and/or humid weather conditions that may cause unit unavailability to be higher than forecast for an extended period. It can be issued on a control zone basis and PJM communicates to members whether fuel limited resources are to be placed into Maximum Emergency category.

A Cold Weather Alert is issued to prepare personnel and facilities for extreme cold weather conditions. It can be initiated when actual temperatures in a zone fall near or below ten degrees Fahrenheit or at higher temperatures if PJM projects a portion of gas fired capacity is unable to obtain spot market gas during load pick-up periods.

HRSRG

Heat recovery steam generator. An air-to-steam heat exchanger.

Increment offers (INC)

Financial offers in the Day-Ahead Energy Market to supply specified amounts of MW at, or above, a given price.

Incremental Auction

Reliability Pricing Model (RPM) auction to allow for an incremental procurement of resource commitments to satisfy an increase in the region's unforced capacity obligation due to a load forecast increase or a decrease in the amount of resource commitments due to a resource cancellation, delay, derating, EFORd increase, or decrease in the nominated value of a Planned Demand Resource.

Inframarginal unit

A unit that is operating, with an accepted offer that is less than the clearing price.

Installed capacity

Installed capacity is the as-tested maximum net dependable capability of the generator, measured in MW.

Load

Demand for electricity at a given time.

Load Management

Previously known as ALM (Active Load Management). ALM was a term that PJM used prior to the implementation of RPM where end use customer load could be reduced at the request of PJM. The ability to reduce metered load, either manually by the customer, after a request from the resource provider which holds the Load management rights or its agent (for Contractually Interruptible), or automatically in response to a communication signal from the resource provider which holds the Load management rights or its agent (for Direct Load Control).

Load-serving entity (LSE)

Load-serving entities provide electricity to retail customers. Load-serving entities include traditional distribution utilities and new entrants into the competitive power market.

Locational Deliverability Area (LDA)

Sub-regions used to evaluate locational constraints. LDAs include EDC zones, sub-zones, and combination of zones.

Marginal unit

The last, highest cost, generation unit to supply power under a merit order dispatch system.

Market-clearing price

The price that is paid by all load and paid to all suppliers.

Market participant

A PJM market participant can be a market supplier, a market buyer or both. Market buyers and market sellers are members that have met creditworthiness standards as established by the PJM Office of the Interconnection.

Market user interface

A thin client application allowing generation sellers to provide and to view generation data, including bids, unit status and market results.

Maximum daily starts

The maximum number of times a unit can start in a day. An operating parameter incorporated in a unit's schedule.

Maximum weekly starts

The maximum number of times a unit can start in a week. An operating parameter incorporated in a unit's schedule.

Mean

The arithmetic average.

Median

The midpoint of data values. Half the values are above and half below the median.

Megawatt (MW)

A unit of power equal to 1,000 kilowatts.

Megawatt-day

One MW of energy flow or capacity for one day.

Megawatt-hour (MWh)

One MWh is a megawatt produced or consumed for one hour.

Megawatt-year

One MW of energy flow or capacity for one calendar year.

Minimum down time

The minimum amount of time that a unit has to stay off before starting again. An operating parameter incorporated in a unit's schedule.

Minimum Offer Price Rule (MOPR)

The MOPR rule sets a floor offer price in the RPM Capacity Market, based on the average net cost of new entry (CONE) for certain classes of new or uprated generation capacity resources as defined in the OATT Attachment DD 5.13(h).

Minimum run time

The minimum amount of time that a unit has to stay on before shutting down. An operating parameter incorporated in a unit's schedule.

Monthly CCM

The capacity credits cleared each month through the PJM Monthly Capacity Credit Market (CCM).

Multimonthly CCM

The capacity credits cleared through PJM Multimonthly Capacity Credit Market (CCM).

Net excess (capacity)

The net of gross excess and gross deficiency, therefore the total PJM capacity resources in excess of the sum of load-serving entities' obligations.

Net exchange (capacity)

Capacity imports less exports.

Net interchange (energy)

Gross import volume less gross export volume in MWh.

Network Transmission Service

Transmission service that is for the sole purpose of serving network load. Network transmission service is only available to network customers.

Noneconomic generation

Units producing energy at an offer price greater than the LMP.

Non-Firm Transmission Service

Point-to-point transmission service under the PJM tariff that is reserved and scheduled on an as available basis and is subject to curtailment or interruption. Non-firm point to point transmission service is available on a stand-alone basis for periods ranging from one hour to one month.

Non-Synchronized Reserve

Reserve MW available within ten minutes, but not synchronized to the grid.

North American Electric Reliability Council (NERC)

A voluntary organization of U.S. and Canadian utilities and power pools established to assure coordinated operation of the interconnected transmission systems.

Off peak

For the PJM Energy Market, off-peak periods are all NERC holidays (i.e., New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, Christmas Day) and weekend hours plus weekdays from the hour ending at midnight until the hour ending at 0700.

On peak

For the PJM Energy Market, on-peak periods are weekdays, except NERC holidays (i.e., New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, Christmas Day) from the hour ending at 0800 until the hour ending at 2300.

Opportunity cost

In general, the value of the opportunity foregone when a specific action is taken. In the ancillary services markets, the difference in compensation from the Energy Market between what a unit receives when providing regulation or synchronized reserve and what it would have received had it provided energy instead.

Parameter-limited schedule

A schedule for a unit that has parameters that are used when the unit fails the three pivotal supplier test, or in a maximum generation emergency event. These parameters are pre-determined by the MMU based on unit class, unless an exception is otherwise granted.

PJM member

Any entity that has completed an application and satisfies the requirements of the PJM Board of Managers to conduct business with PJM, including transmission owners, generating entities, load-serving entities and marketers.

PJM planning year

The calendar period from June 1 through May 31.

Point of Receipt (POR) and Point of Delivery (POD)

Designations used on a transmission reservation. The designations, when combined, determine the transmission reservations' market path.

Pool-scheduled resource

A generating resource that the seller has turned over to PJM for scheduling and control.

Price duration curve

A graphic representation of the percent of hours that a system's price was at or below a given level during the year.

Price-sensitive bid

Purchases of a defined MW level of energy only up to a specified LMP. Above that LMP, the load bid is zero.

Primary operating interfaces

Primary operating interfaces are typically defined by a cross section of transmission paths or single facilities which affect a wide geographic area. These interfaces are modeled as constraints whose operating limits are respected in performing dispatch operations.

Ramp-limited desired (MW)

The achievable MW based on the UDS requested ramp rate.

Reactive Service

Reactive Service, Reactive Supply and Voltage Control from Generation or Other Sources Service, is provided by generation and other sources (such as static VAR compensators and capacitor banks) of reactive power (measured in VAR). Reactive power helps maintain appropriate voltages on the transmission system and is essential to the flow of real power (measured in MW).

RegA

PJM's slow-oscillation regulation signal designed for resources with the ability to sustain energy output for long periods of time, but with limited ramp rates. PJM can satisfy the RTO-wide regulation requirement with only RegA resources.

RegD

PJM's fast-oscillation regulation signal designed for resources with the ability to quickly adjust energy output, but with limited ability to sustain energy output for long periods of time. PJM cannot satisfy the RTO-wide regulation requirement with only RegD resources.

Regional Transmission Expansion Planning (RTEP) Protocol

The process by which PJM recommends specific transmission facility enhancements and expansions based on reliability and economic criteria. Regulation is an ancillary service that corrects short-term imbalances between generation and load and is provided by resources capable of responding to a PJM-generated signal.

ReliabilityFirst Corporation

ReliabilityFirst Corporation (RFC) began operation January 1, 2006, as the successor to three other reliability organizations: the Mid-Atlantic Area Council (MAAC), the East Central Area Coordination Agreement (ECAR), and the Mid-American Interconnected Network (MAIN). PJM is registered with RFC to comply with its reliability standards for balancing authority (BA), planning coordinator (PC), reliability coordinator (RC), resource planner (RP), transmission operator (TOP), transmission planner (TP) and transmission service provider (TSP).

Reliability Pricing Model (RPM)

PJM's resource adequacy construct. The purpose of RPM is to develop a long term pricing signal for capacity resources and LSE obligations that is consistent with the PJM Regional Transmission Expansion Planning Process (RTEPP). RPM adds stability and a locational nature to the pricing signal for capacity.

Reserve

Energy available within a defined time for the purpose of correcting an imbalance between supply and demand.

Selective catalytic reduction (SCR)

NO_x reduction equipment usually installed on combined-cycle generators.

Self-scheduled generation

Units scheduled to run by their owners regardless of system dispatch signal. Self-scheduled units do not follow system dispatch signal and are not eligible to set LMP. Units can be submitted as a fixed block of MW that must be run, or as a minimum amount of MW that must run plus a dispatchable component above the minimum.

Shadow price

The constraint shadow price represents the incremental reduction in congestion cost achieved by relieving a constraint by 1 MW. The shadow price multiplied by the flow (in MW) on the constrained facility during each hour equals the hourly gross congestion cost for the constraint.

Short-Term Resource Procurement Target

The Short-Term Resource Procurement Target is equal to 2.5% of the PJM Region Reliability Requirement determined for such Base Residual Auction, 2% of the of the PJM Region Reliability Requirement as calculated at the time of the Base Residual Auction for purposes of the First Incremental Auction, and 1.5% of the of the PJM Region Reliability Requirement as calculated at the time of the Base Residual Auction for purposes of the Second Incremental Auction. The stated rationale for this administrative reduction in demand is to permit short lead time resource procurement in later auctions for the delivery year.

Sources and sinks

Sources are the origins or the injection end of a transmission transaction. Sinks are the destinations or the withdrawal end of a transaction.

Spot Import Transmission Service

Transmission service introduced as an option for non-load serving entities to offer into the PJM spot market at the border/interface as price takers.

Spot market

Transactions made in the Real-Time and Day-Ahead Energy Market at hourly LMP.

Static Var compensator

A static Var compensator (SVC) is an electrical device for providing fast-acting, reactive power compensation on high-voltage electricity transmission networks.

Summer Net Capability

The Summer Net Capability of each unit or station shall be based on summer conditions and on the power factor level normally expected for that unit or station at the time of the PJM summer peak load.

Summer conditions shall reflect the 50% probability of occurrence (approximated by the mean) of temperature and humidity conditions of the time of the PJM summer peak load. Conditions shall be based on local weather bureau records of the past 15 years, updated at 5 year intervals. When local weather records are not available, the values shall be estimated from the best data available.

For steam units, summer conditions shall mean, where applicable, the probable intake water temperature of once-through or open cooling systems experienced in June, July, and August at the time of the PJM peak each weekday.

For combustion turbine units, summer conditions shall mean, where applicable, the probable ambient air temperature and humidity condition experienced at the unit location at the time of the annual summer PJM peak.

The determination of the Summer Net Capability of hydro and pumped storage units shall be based on operational data or test results taken once each year at any time during the year. The same operational data or test results can be used for the determination of the Winter Net Capability.

For combined-cycle units, summer conditions shall mean where applicable, the probable intake water temperature of once-through or open cooling systems experienced in June, July, and August at the time of the PJM peak each weekday, and the probable ambient air temperature and humidity condition experienced at the unit location at the time of the annual summer PJM peak.

Supply deviations

Hourly deviations in the supply category, equal to the difference between the sum of cleared increment offers, day-ahead purchases, and day-ahead imports, to the sum of real-time purchases and real-time imports.

Synchronized reserve

Reserve capability which is required in order to enable an area to restore its tie lines to the pre-contingency state within 10 minutes of a contingency that causes an imbalance between load and generation. During normal operation, these reserves must be provided by increasing energy output on electrically synchronized equipment, by reducing load on pumped storage hydroelectric facilities or by reducing the demand by demand-side resources. During system restoration, customer load may be classified as synchronized reserve.

System installed capacity

System total installed capacity measures the sum of the installed capacity (in installed, not unforced, terms) from all internal and qualified external resources designated as PJM capacity resources.

System lambda

The cost to the PJM system of generating the next unit of output.

Temperature-humidity index (THI)

A temperature-humidity index (THI) gives a single, numerical value reflecting the outdoor atmospheric conditions of temperature and humidity as a measure of comfort (or discomfort) during warm weather. THI is defined as: $THI = T_d - (0.55 - 0.55RH) * (T_d - 58)$ if T_d is > 58 ; else $THI = T_d$ (where T_d is the dry-bulb temperature and RH is the percentage of relative humidity.)

Transmission Adequacy and Reliability Assessment (TARA)

An analysis tool that can calculate generation to load impacts. This tool is used to facilitate loop flow analysis across the Eastern Interconnection.

Turn down ratio

The ratio of dispatchable megawatts on a unit's schedule. Calculated by a unit's economic maximum MW divided by its economic minimum MW. An operating parameter of a unit's schedule.

Unforced capacity

Installed capacity adjusted by forced outage rates.

Western region

Defined region for purposes of allocating balancing operating reserve charges. Includes the AEP, AP, ComEd, DLCO, and DAY transmission zones.

Wheel-through

An energy transaction flowing through a transmission grid whose origination and destination are outside of the transmission grid.

Winter Weather Parameter (WWP)

WWP is wind speed adjusted temperature. WWP is defined as: $WWP = T_d - (0.5 * (WIND - 10))$ if $WIND > 10$ mph; $WWP = T_d$ if $WIND \leq 10$ mph (where T_d is the dry-bulb temperature and WIND is the wind speed.)

Zone

See “Control zone” (above).

List of Acronyms

AC2	Advanced Control Center	AU	Associated unit
ACE	Area control error	BA	Balancing authority
ACR	Avoidable cost rate	BAAL	Balancing authority ACE limit
AECI	Associated Electric Cooperative Inc.	BACT	Best Available Control Technology
AECO	Atlantic City Electric Company	BGE	Baltimore Gas and Electric Company
AEG	Alliant Energy Corporation	BGS	Basic generation service
AEP	American Electric Power Company, Inc.	BME	Balancing market evaluation
AGC	Automatic generation control	BOR	Balancing Operating Reserve
ALM	Active load management	BORCA	Balancing operating reserve cost allocation
ALR	Automatic load rejection black start	BRA	Base Residual Auction
ALTE	Eastern Alliant Energy Corporation	BSSWG	Black Start Services Working Group
ALTW	Western Alliant Energy Corporation	BTU	British thermal unit
AMI	Advanced Metering Infrastructure	BTM	Behind the meter
AMIL	Ameren - Illinois	C&I	Commercial and industrial customers
AMRN	Ameren	CAAA	Clean Air Act Amendments

EFORD	Equivalent demand forced outage rate	FRR	Fixed resource requirement
EFORp	Equivalent forced outage rate during peak hours	FSL	Firm service load
EHV	Extra-high-voltage	FTR	Financial transmission right
EIS	Environmental Information Services	FTRTF	Financial Transmission Rights Task Force
EKPC	East Kentucky Power Cooperative, Inc.	GACT	Generally Available Control Technology
ELRP	Economic load response program	GCA	Generation control area
EMAAC	Eastern Mid-Atlantic Area Council	GE	General Electric Company
EMOF	Equivalent maintenance outage factor	GHG	Greenhouse Gas
EMS	Energy management system	GLD	Guaranteed load drop
EMUSTF	Energy Market Uplift Senior Task Force	GSU	Generator Step-Up Transformers
EPA	Environmental Protection Agency	GW	Gigawatt
EPOF	Equivalent planned outage factor	GWh	Gigawatt-hour
EPT	Eastern Prevailing Time	HAP	Hazardous air pollutants
ESP	Electrostatic precipitators (Baghouses)	HE	Hour Ending
EST	Eastern Standard Time	HEDD	NJ High Energy Demand Day
ExGen	Exelon Generation Company, L.L.C.	HHI	Herfindahl-Hirschman Index
FE	FirstEnergy Corp.	HRSG	Heat recovery steam generator
		HVDC	High-voltage direct current
		Hz	Hertz

IARR	Incremental ARRs	JRCA	Joint Reliability Coordination Agreement
IA	RPM Incremental Auction		
IBTs	Internal Bilateral Transactions	KV	KiloVolt
ICAP	Installed capacity	KDAEV	Known Day-Ahead Error Value
ICCP	Inter-control center protocol	LAER	Lowest Achievable Emissions Rate
IDC	Interchange distribution calculator	LAS	PJM Load Analysis Subcommittee
IESO	Ontario Independent Electricity System Operator	LCA	Load control area
IGCC	Integrated Gasification Combined Cycle	LDA	Locational deliverability area
ILR	Interruptible load for reliability	LGEE	LG&E Energy, L.L.C.
INC	Increment offer	LIND	Linden Variable Frequency Transformer (VFT)
IP	Illinois Power Company	LM	Load management
IPL	Indianapolis Power & Light Company	LMP	Locational marginal price
IPP	Independent power producer	LMTF	Load Management Task Force
IPSTF	Interconnection Process Senior Task Force	LOC	Lost opportunity cost
IRM	Installed reserve margin	LPC	Locational Pricing Calculator
IROL	Interconnection Reliability Operating Limit	LSE	Load-serving entity
IRR	Internal rate of return	M2M	Market to market
ISA	Interconnection service agreement	MAAC	Mid-Atlantic Area Council
ISO	Independent system operator	MAAC+APS	Mid-Atlantic Area Council plus the Allegheny Power System
ITSCED	Intermediate term security constrained economic dispatch	MACRS	Modified accelerated cost recovery schedule
JCPL	Jersey Central Power & Light Company	MACT	Maximum Achievable Control Technology
JOA	Joint operating agreement	MAD	Mid-Atlantic Dominion subzone
JOU	Jointly owned units	MAIN	Mid-America Interconnected Network, Inc.
		MAPP	Mid-Continent Area Power Pool

MATS	Mercury and Air Toxics Standards rule	NAESB	North American Energy Standards Board
MCP	Market-clearing price	NAAQS	National Ambient Air Quality Standards
MDS	Maximum daily starts	NBT	Net Benefits Test
MDT	Minimum down time	NCMPA	North Carolina Municipal Power Agency
MEC	MidAmerican Energy Company	NEPT	Neptune DC line
MECS	Michigan Electric Coordinated System	NERC	North American Electric Reliability Council
Met-Ed	Metropolitan Edison Company	NESHAP	National Emission Standards for Hazardous Air Pollutants
MIC	Market Implementation Committee	NICA	Northern Illinois Control Area
MICHFE	The pricing point for the Michigan Electric Coordinated System and FirstEnergy control areas	NIPSCO	Northern Indiana Public Service Company
MIL	Mandatory interruptible load	NJDEP	New Jersey Department of Environmental Protection
MIS	Market information system	NNL	Network and native load
MISO	Midcontinent Independent Transmission System Operator, Inc.	NOPR	Notice of Proposed Rulemaking
MMU	PJM Market Monitoring Unit	NOx	Nitrogen oxides
Mon Power	Monongahela Power	NPS	National Park Service
MOPR	Minimum Offer Price Rule	NSPS	New Source Performance Standards
MP	Market participant	NSR	New Source Review
MP2	Monitored Priority 2	NUG	Non-utility generator
MRC	Markets and reliability committee	NYISO	New York Independent System Operator
MRT	Minimum run time	OA	Amended and Restated Operating Agreement of PJM Interconnection, L.L.C.
MUI	Market user interface	OASIS	Open Access Same-Time Information System
MW	Megawatt		
MWh	Megawatt-hour		
MWS	Maximum weekly starts		

OATI	Open Access Technology International, Inc.	PJM/AEPPJM	The interface between the American Electric Power Control Zone and PJM
OATT	PJM Open Access Transmission Tariff	PJM/AEPVP	The single interface pricing point formed in March 2003 from the combination of two previous interface pricing points: PJM/American Electric Power Company, Inc. and PJM/Dominion Resources, Inc.
ODEC	Old Dominion Electric Cooperative		
OEM	Original equipment manufacturer		
OI	PJM Office of the Interconnection		
Ontario IESO	Ontario Independent Electricity System Operator	PJM/AEPVPEXP	The export direction of the PJM/AEPVP interface pricing point
OPSI	Organization of PJM States, Inc.	PJM/AEPVPIMP	The import direction of the PJM/AEPVP interface pricing point
OMC	Outside Management Control		
OVEC	Ohio Valley Electric Corporation	PJM/ALTE	The interface between PJM and the eastern portion of the Alliant Energy Corporation's control area
ORS	NERC Operating Reliability Subcommittee	PJM/ALTW	The interface between PJM and the western portion of the Alliant Energy Corporation's control area
PAR	Phase angle regulator		
PATH	Potomac – Appalachian Transmission Highline	PJM/AMRN	The interface between PJM and the Ameren Corporation's control area
PCLLRW	Post Contingency Local Load Relief Warning	PJM/CILC	The interface between PJM and the Central Illinois Light Company's control area
PE	PECO Zone		
PEC	Progress Energy Carolinas, Inc.	PJM/CIN	The interface between PJM and the Cinergy Corporation's control area
PECO	PECO Energy Company	PJM/CPLE	The interface between PJM and the eastern portion of the Carolina Power & Light Company's control area
PENELEC	Pennsylvania Electric Company		
Pepco	Formerly Potomac Electric Power Company or PEPCO	PJM/CPLW	The interface between PJM and the western portion of the Carolina Power & Light Company's control area
PHI	Pepco Holdings, Inc.		
PJM	PJM Interconnection, L.L.C.		
PJM/AEPNI	The interface between the American Electric Power Control Zone and Northern Illinois	PJM/CWPL	The interface between PJM and the City Water, Light & Power's (City of Springfield, IL) control area

PJM/DLCO	The interface between PJM and the Duquesne Light Company's control area	PJM/NYIS	The interface between PJM and the New York Independent System Operator
PJM/DUK	The interface between PJM and the Duke Energy Corp.'s control area	PJM/Ontario IESO	PJM/Ontario IESO pricing point
PJM/EKPC	The interface between PJM and the Eastern Kentucky Power Corporation's control area	PJM/OVEC	The interface between PJM and the Ohio Valley Electric Corporation's control area
PJM/FE	The interface between PJM and the FirstEnergy Corp.'s control area	PJM/TVA	The interface between PJM and the Tennessee Valley Authority's control area
PJMICC	PJM Industrial Customer Coalition	PJM/VAP	The interface between PJM and the Dominion Virginia Power's control area
PJM/IP	The interface between PJM and the Illinois Power Company's control area	PJM/WEC	The interface between PJM and the Wisconsin Energy Corporation's control area
PJM/IPL	The interface between PJM and the Indianapolis Power & Light Company's control area	PLC	Peak Load Contribution
PJM/LGEE	The interface between PJM and the Louisville Gas and Electric Company's control area	PLS	Parameter limited schedule
PJM/LIND	The interface between PJM and the New York System Operator over the Linden VFT line	PMSS	Preliminary market structure screen
PJM/MEC	The interface between PJM and MidAmerican Energy Company's control area	PNNE	PENELEC's northeastern subarea
PJM/MECS	The interface between PJM and the Michigan Electric Coordinated System's control area	PNNW	PENELEC's northwestern subarea
PJM/MISO	The interface between PJM and the Midwest Independent System Operator	POD	Point of delivery
PJM/NEPT	The interface between PJM and the New York Independent System Operator over the Neptune DC line	POR	Point of receipt
PJM/NIPS	The interface between PJM and the Northern Indiana Public Service Company's control area	PPB	Parts per billion
		PPL	PPL Electric Utilities Corporation
		PSE&G	Public Service Electric and Gas Company (a wholly owned subsidiary of PSEG)
		PSEG	Public Service Enterprise Group
		PSD	Prevention of Significant Deterioration
		PSN	PSEG north

PSNC	PSEG north central	RSIx	Residual supply index, using “x” pivotal suppliers
QF	Qualifying Facility	RTC	Real-time commitment
RAA	Reliability Assurance Agreement among Load-Serving Entities	RTEP	Regional Transmission Expansion Plan
RAC	Reliability Assessment Commitment	RTO	Regional transmission organization
RCF	Reciprocal Coordinated Flowgate	SAA	Symmetrical Additive Adjustment
RCIS	Reliability Coordinator Information System	SCE&G	South Carolina Energy and Gas
REC	Renewable Energy Credit	SCED	Security Constrained Economic Dispatch
RECO	Rockland Electric Company zone	SCPA	South central Pennsylvania subarea
RFC	ReliabilityFirst Corporation	SCR	Selective catalytic reduction
RFP	Request for Proposal	SEPA	Southeast Power Administration
RGGI	Regional Greenhouse Gas Initiative	SEPJM	Southeastern PJM subarea
RICE	Reciprocating Internal Combustion Engines	SERC	SERC Reliability Corporation
RLD (MW)	Ramp-limited desired (Megawatts)	SIPs	State Implementation Plan
RLR	Retail load responsibility	SFT	Simultaneous feasibility test
RMCCP	Regulation market capability clearing price	SMECO	Southern Maryland Electric Cooperative
RMCP	Regulation market-clearing price	SMP	System marginal price
RMPCP	Regulation market performance clearing price	SNCR	Selective Non-Catalytic Reduction
RMR	Reliability Must Run	SNJ	Southern New Jersey
ROFR	Right of First Refusal	SO2	Sulfur dioxide
RPM	Reliability Pricing Model	SOUTHEXP	South Export pricing point
RPS	Renewable Portfolio Standard	SOUTHIMP	South Import pricing point
RRMSE	Relative Root Mean Squared Error	SPP	Southwest Power Pool, Inc.
RSI	Residual supply index	SPREGO	Synchronized reserve and regulation optimizer (market-clearing software)

SRMCP	Synchronized reserve market-clearing price	ULSD	Ultra-Low Sulfur Diesel
SRSTF	System Restoration Strategy Task Force	UPF	Unit participation factor
STD	Standard deviation	VACAR	Virginia and Carolinas Area
STRPTAS	Short Term Resource Procurement Applicable Share	VAP	Dominion Virginia Power
SVC	Static Var compensator	VFT	Variable frequency transformer
SWMAAC	Southwestern Mid-Atlantic Area Council	VOCs	Volatile Organic Compounds
TARA	Transmission adequacy and reliability assessment	VOM	Variable operation and maintenance expense
TDR	Turn down ratio	VRR	Variable resource requirement
TEAC	Transmission Expansion Advisory Committee	WEC	Wisconsin Energy Corporation
THI	Temperature-humidity index	WLR	Wholesale load responsibility
TISTF	Transactions Issues Senior Task Force	WPC	Willing to pay congestion
TLR	Transmission loading relief	WWP	Winter Weather Parameter
TPS	Three pivotal supplier	XEFORD	EFORD modified to exclude OMC outages
TPSTF	Three Pivotal Supplier Task Force		
TPY	Tons Per Year		
TrAIL	Trans – Allegheny Interstate Line		
TSA	Thunderstorm Alert		
TSIN	NERC Transmission System Information Network		
TVA	Tennessee Valley Authority		
UCAP	Unforced capacity		
UDS	Unit dispatch system		
UGI	UGI Utilities, Inc.
