

## Net Revenue

The Market Monitoring Unit (MMU) analyzed measures of PJM energy market structure, participant conduct and market performance. As part of the review of market performance, the analysis includes the theoretical new entrant net revenues for combustion turbine (CT), combined cycle (CC), coal plant (CP), diesel (DS), nuclear, solar, and wind generating units.

## Overview

### Net Revenue

- Energy market net revenues are significantly affected by energy prices and fuel prices. Energy prices, gas prices and coal prices increased in the first three months of 2025 compared to the first three months of 2024. The net effects were that in the first three months of 2025, average energy market theoretical net revenues increased by 45 percent for a new combustion turbine (CT), increased by 51 percent for a new combined cycle (CC), increased by 202 percent for a new coal plant (CP), increased by 67 percent for a new nuclear plant, increased by 243 percent for a new diesel (DS), increased by 82 percent for a new onshore wind installation, increased by 80 percent for a new offshore wind installation and increased by 121 percent for a new solar installation.
- The price of natural gas and coal increased in the first three months of 2025. The marginal costs of a new CT were greater than the marginal cost of a new CP in January, February and March 2025. The marginal costs of a new CC were greater than the marginal cost of a new CP in January and February, 2025.
- In the first three months of 2025, spark spreads and dark spreads and the volatility of spark spreads and dark spreads increased in BGE, COMED and Western Hub compared to the first three months of 2024. In the first three months of 2025, spark spreads decreased while dark spreads and the volatility of both spark spreads and dark spreads increased in PSEG compared to the first three months of 2024.

- Of the 16 PJM nuclear plants analyzed, all are expected to cover their avoidable costs from energy and capacity market revenues in 2025 and 2026, without any subsidies.

## Recommendations

- The MMU recommends that the net revenue calculation used by PJM to calculate the net Cost of New Entry (CONE) and net ACR be based on a forward looking calculation of expected energy and ancillary services net revenues using historical revenues that are scaled based on forward prices for energy and fuel. (Priority: Medium. First reported 2019. Status: Not adopted.)

## Conclusion

Wholesale electric power markets are affected by externally imposed reliability requirements. A regulatory authority external to the market makes a determination as to the acceptable level of reliability which is enforced through a requirement to maintain a target level of installed or unforced capacity. The requirement to maintain a target level of installed capacity can be enforced via a variety of mechanisms, including government construction of generation, full requirement contracts with developers to construct and operate generation, state utility commission mandates to construct capacity, or capacity markets of various types. Regardless of the enforcement mechanism, the exogenous requirement to construct capacity in excess of what is constructed in response to energy market signals alone has an impact on energy markets. The reliability requirement results in maintaining a level of capacity in excess of the level that would result from the operation of an energy market alone. The result of that additional capacity is to reduce the level and volatility of energy market prices and to reduce the duration of high energy market prices. This, in turn, reduces net revenue to generation owners which reduces the incentive to invest. The exact level of both aggregate and locational excess capacity is a function of the calculation methods used by RTOs and ISOs. A basic purpose of the capacity market is to allow all cleared capacity resources the opportunity to cover their net avoidable costs on an

annual basis to ensure the economic sustainability of the reliable energy market.

PJM's introduction of a form of ELCC for defining available capacity has made the definition of reliability less clear. The reduction of ELCC derated capacity is volatile and subject to changes for reasons that are not clear to generation owners or other market participants. There are significant issues with PJM's implementation of its approach to ELCC.

## Net Revenue

When compared to annualized fixed costs and avoidable costs, net revenue is an indicator of generation investment profitability, and thus is a measure of overall market performance as well as a measure of the incentive to invest in new generation and to maintain existing generation in PJM markets. Net revenue equals total revenue received by generators from PJM energy, capacity and ancillary service markets, including uplift payments, and from the provision of black start and reactive services and capability, and from subsidies like RECs, less the short run marginal costs of energy production. In other words, net revenue is the amount that remains, after the short run marginal costs of energy production have been subtracted from gross revenue. Net revenue is the contribution to fixed costs, which include a return on investment, depreciation and income taxes, and to avoidable costs, which include long term and intermediate term operation and maintenance expenses.<sup>1</sup> Net revenue is the contribution to total fixed and avoidable costs received by generators from all PJM markets.

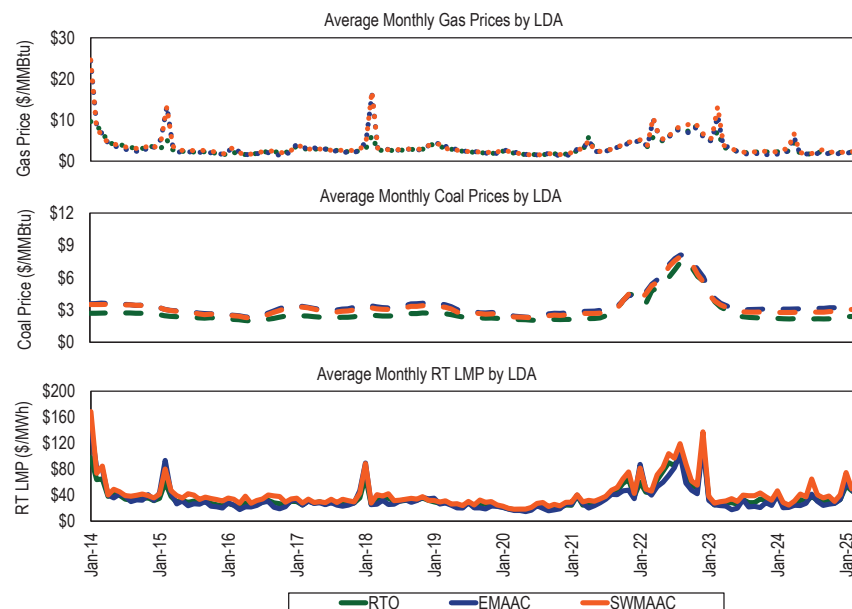

In a perfectly competitive, energy only market in long run equilibrium, net revenue from the energy market would be expected to equal the annualized fixed and avoidable costs for the marginal unit, including a competitive return on investment. The PJM market design includes other markets that contribute to the payment of fixed and avoidable costs. In PJM, the energy, capacity and ancillary service markets are all significant sources of revenue to cover the fixed and avoidable costs of generators, as are payments for the provision of black start and reactive services. Thus, in a perfectly competitive market in

long run equilibrium, with energy, capacity and ancillary service markets, net revenue from all sources would be expected to equal the annualized fixed and avoidable costs of generation for the marginal unit. Net revenue is a measure of whether generators are receiving competitive returns on invested capital and of whether market prices are high enough to encourage entry of new capacity and to encourage maintaining existing capacity. In actual wholesale power markets, where equilibrium seldom occurs, net revenue is expected to fluctuate above and below the equilibrium level based on actual conditions in all relevant markets. The current definition of net revenue is not fully accurate as the FERC ordered definition uses price-based offers at times and does not include revenue from opportunity cost adders for environmentally constrained resources.

Net revenues are significantly affected by energy prices, fuel prices and capacity prices. The real-time load-weighted average LMP in the first three months of 2025 increased 68.3 percent from the first three months of 2024, from \$31.01 per MWh to \$52.20 per MWh. Gas prices and coal prices increased in the first three months of 2025 compared to the first three months of 2024. The price of eastern natural gas was 125.3 percent higher, the price of western natural gas was 58.8 percent higher; the price of Northern Appalachian coal was 7.5 percent higher; the price of Central Appalachian coal was 8.0 percent higher; and the price of Powder River Basin coal was 2.8 percent higher (Figure 7-1).

<sup>1</sup> Avoidable costs are sometimes referred to as going forward costs.

**Figure 7-1 Energy market net revenue factor trends: 2014 through March 2025**

## Spark Spreads and Dark Spreads

The spark or dark spread is defined as the difference between the LMP received for selling power and the cost of fuel used to generate power, converted to a cost per MWh. The spark spread compares power prices to the cost of gas and the dark spread compares power prices to the cost of coal. The spread is a measure of the approximate difference between revenues and marginal costs and is an indicator of net revenue and profitability.

$$\text{Spread} \left( \frac{\$}{\text{MWh}} \right) = \text{LMP} \left( \frac{\$}{\text{MWh}} \right) - \text{Fuel Price} \left( \frac{\$}{\text{MMBtu}} \right) * \text{Heat Rate} \left( \frac{\text{MMBtu}}{\text{MWh}} \right)$$

Spread volatility is a result of fluctuations in LMP and the price of fuel. Spreads can be positive or negative.

In the first three months of 2025, spark spreads and dark spreads and the volatility of spark spreads and dark spreads increased in BGE, COMED and Western Hub compared to the first three months of 2024. In the first three months of 2025, spark spreads decreased while dark spreads and the volatility of both spark spreads and dark spreads increased in PSEG compared to the first three months of 2024.

Table 7-1 shows average peak hour spreads by year and Table 7-2 shows the associated standard deviations.

**Table 7-1 Peak hour spark and dark spreads (\$/MWh)**

	BGE		COMED		PSEG		Western Hub	
Jan-Mar	Spark	Dark	Spark	Dark	Spark	Dark	Spark	Dark
2024	\$17.22	\$11.50	\$10.75	\$7.35	\$9.15	(\$0.51)	\$13.82	\$8.74
2025	\$23.06	\$34.02	\$10.90	\$18.95	(\$6.60)	\$20.68	\$14.68	\$27.83
Percent change	34%	196%	1%	158%	NA	NA	6%	218%

**Table 7-2 Peak hour spark and dark spread standard deviation (\$/MWh)**

	BGE		COMED		PSEG		Western Hub	
Jan-Mar	Spark	Dark	Spark	Dark	Spark	Dark	Spark	Dark
2024	\$24.9	\$29.5	\$22.5	\$21.1	\$22.0	\$25.6	\$23.6	\$24.6
2025	\$54.9	\$64.9	\$28.7	\$32.1	\$97.8	\$38.7	\$56.4	\$45.6
Percent change	121%	120%	28%	52%	345%	51%	139%	85%

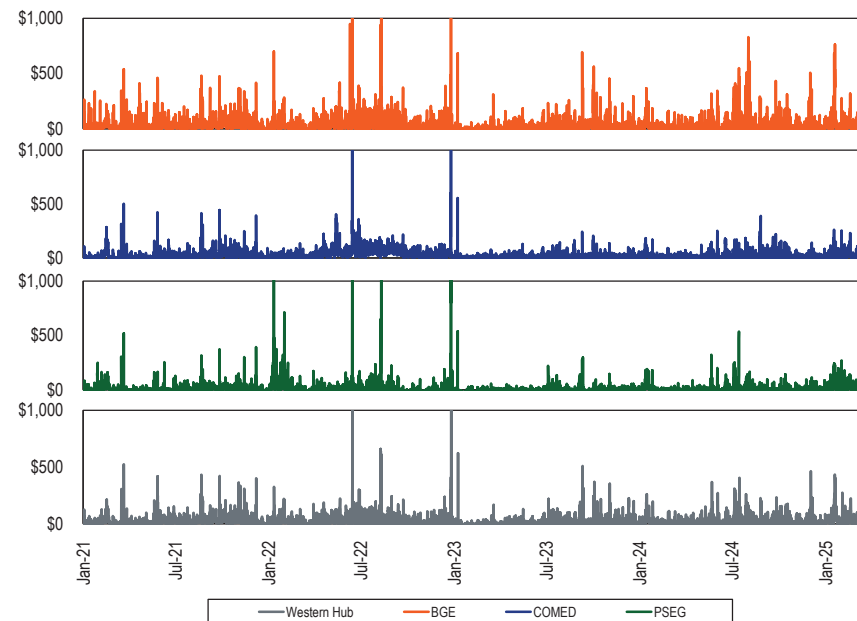

Figure 7-2 shows the hourly spark spread for peak hours for BGE, COMED, PSEG, and Western Hub.

**Figure 7-2 Hourly spark spread (gas) for peak hours (\$/MWh): 2021 through March 2025<sup>2</sup>**

<sup>2</sup> Spark spreads use a combined cycle heat rate of 7,000 Btu/kWh, zonal hourly LMPs and daily gas prices; Chicago City Gate for COMED, Zone 6 non-NY for BGE, Zone 6 NY for PSEG, and Texas Eastern M3 for Western Hub.

**Figure 7-3 Hourly dark spread (coal) for peak hours (\$/MWh): 2021 through March 2025<sup>3</sup>**

<sup>3</sup> Dark spreads use a heat rate of 10,000 Btu/kWh, zonal hourly LMPs, daily coal prices, and average transportation costs by coal type; Powder River Basin coal for COMED, Northern Appalachian coal for BGE and Western Hub, and Central Appalachian coal for PSEG.

## Theoretical Energy Market Net Revenue

The net revenues presented in this section are theoretical as they are based on explicitly stated assumptions about how a new unit with specific characteristics would operate under economic dispatch. The economic dispatch uses technology specific operating constraints in the calculation of a new unit's operations and potential net revenue in PJM markets.

Analysis of energy market net revenues for a new unit includes eight power plant configurations:

- The CT plant is a single GE Frame 7HA.03 CT with an installed capacity of 409.3 MW, equipped with evaporative coolers, and selective catalytic reduction (SCR) for NO<sub>x</sub> reduction, and dual fuel capability.
- The CC plant includes two single shaft 1x1 GE Frame 7HA.02 CTs, each with a single combustion turbine, heat recovery steam generator, and steam turbine with a total installed capacity of 1,362 MW, equipped with SCR for NO<sub>x</sub> reduction, dry cooling, duct burners, and dual fuel capability.
- The CP is a subcritical steam unit with an installed capacity of 600.0 MW, equipped with selective catalytic reduction system (SCR) for NO<sub>x</sub> control, a flue gas desulfurization (FGD) system with chemical injection for SO<sub>x</sub> and mercury control, and a baghouse for particulate control.
- The DS plant is a single oil fired CAT 2 MW unit with an installed capacity of 2.0 MW using New York Harbor ultra low sulfur diesel.
- The nuclear plant includes two units and related facilities using the Westinghouse AP1000 technology with an installed capacity of 2,200 MW.
- The onshore wind installation includes 104 Siemens 2.9 MW wind turbines with an installed capacity of 301.6 MW.
- The offshore wind installation includes of 40 Siemens 10.0 MW wind turbines with an installed capacity of 400.0 MW.
- The solar installation is a 472 acre ground mounted tracking solar farm with an installed AC capacity of 200 MW.
- The battery storage unit is a 2.5 MW, 10 hour battery capable of providing 2.5 MWh for 10 hours, or 25 MWh.

Net revenue calculations for the CT, CC and CP include the hourly effect of actual local ambient air temperature on plant heat rates and generator output for each of the three plant configurations.<sup>4 5</sup> Plant heat rates account for the efficiency changes and corresponding cost changes resulting from ambient air temperatures.

CO<sub>2</sub>, NO<sub>x</sub> and SO<sub>2</sub> emission allowance costs are included in the hourly plant dispatch cost, the short run marginal cost.<sup>6</sup> CO<sub>2</sub>, NO<sub>x</sub> and SO<sub>2</sub> emission allowance costs were obtained from daily spot cash prices.<sup>7</sup>

The class average equivalent availability factor for each type of plant was calculated from PJM data and incorporated into all revenue calculations.<sup>8</sup>

Zonal net revenues reflect average zonal LMP and fuel costs based on locational fuel indices and zone specific delivery charges.<sup>9</sup> The delivered fuel cost for natural gas reflects the zonal, daily delivered price of natural gas from a specific pipeline and is from published commodity daily cash prices, with a basis adjustment for transportation costs.<sup>10</sup> The delivered cost of coal reflects the zone specific, delivered price of coal and was developed from the published prompt month prices, adjusted for rail transportation costs.<sup>11</sup> Net revenues are calculated for all zones except OVEC.<sup>12</sup>

Short run marginal cost includes fuel costs, emissions costs, and the short run marginal component of VOM costs.<sup>13 14</sup> Average short run marginal costs are

<sup>4</sup> Hourly ambient conditions supplied by DTN.

<sup>5</sup> Heat rates provided by Pasteris Energy, Inc. No load costs are included in the dispatch price since each unit type is dispatched at full load for every economic hour resulting in a single offer point.

<sup>6</sup> CO<sub>2</sub> emission allowance costs only included for states participating in RGGI.

<sup>7</sup> CO<sub>2</sub>, NO<sub>x</sub> and SO<sub>2</sub> emission daily prompt prices obtained from Evolution Markets, Inc.

<sup>8</sup> Outage figures obtained from the PJM eGADS database.

<sup>9</sup> Startup fuel burns and emission rates provided by Pasteris Energy, Inc. Startup station power consumption costs were obtained from the station service rates published quarterly by PJM and netted against the MW produced during startup at the preceding applicable hourly LMP. All starts associated with combined cycle units are assumed to be warm starts.

<sup>10</sup> Gas daily cash prices obtained from Platts.

<sup>11</sup> Coal prompt month prices obtained from Platts.

<sup>12</sup> The Ohio Valley Electric Corporation (OVEC) includes a generating plant in Ohio and a generating plant in Indiana, and high voltage transmission lines, but does not occupy a single geographic footprint like the other control zones.

<sup>13</sup> Fuel costs are calculated using the daily spot price and may not equal what individual participants actually paid.

<sup>14</sup> VOM rates provided by Pasteris Energy, Inc.

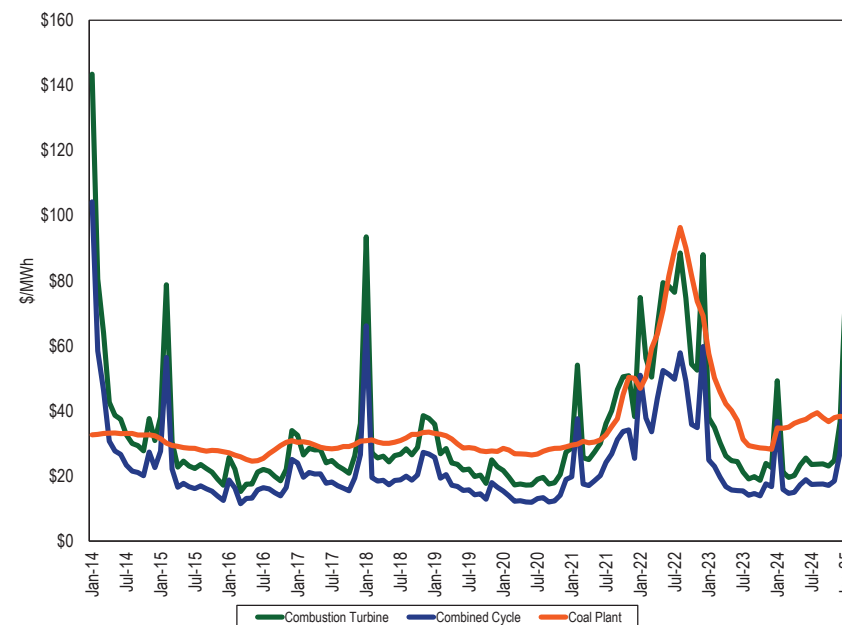

shown, including all components, in Table 7-34 and the short run marginal component of VOM is also shown separately.

**Table 7-3 Average short run marginal costs: January through March, 2025**

Unit Type	Short Run Marginal Costs (\$/MWh)	Heat Rate (Btu/kWh)	VOM (\$/MWh)
CT	\$54.30	9,241	\$0.54
CC	\$40.50	6,369	\$0.88
CP	\$35.35	9,250	\$5.64
DS	\$178.19	9,660	\$0.25
Nuclear	\$0.00	NA	\$0.00
Wind	\$0.00	NA	\$0.00
Wind (off shore)	\$0.00	NA	\$0.00
Solar	\$0.00	NA	\$0.00

A comparison of the monthly average short run marginal cost of the theoretical CT, CC and CP plants since 2014 shows that, on average, the short run marginal costs of the CC plant have been less than those of the CP plant but the costs of the CC plant have been more volatile than the costs of the CP plant as a result of the higher volatility of gas prices compared to coal prices (Figure 7-4). The average monthly marginal costs of a new CC and CT were greater than the marginal cost of a new CP in January and February 2025 and the average monthly marginal costs of a new CT were greater than the marginal cost of a new CP in March 2025 as well. Marginal costs are based on spot fuel costs. Individual generation plants may have contracts for coal that differ significantly from spot prices.

**Figure 7-4 Average short run marginal costs: 2014 through March 2025**

The net revenue measure does not include the potentially significant contribution from the explicit or implicit sale of the option value of physical units or from bilateral agreements to sell output at a price other than the PJM day-ahead or real-time energy market prices, e.g., a forward price.

Gas prices, coal prices, and energy prices are reflected in new unit capacity factors. Table 7-45 shows the average capacity factor for new units. The capacity factors for a new CP increased in the first three months of 2025 compared to the first three months of 2024.

**Table 7-4 Average capacity factor: January through March, 2014 through 2025**

## New Entrant Combustion Turbine

Energy market net revenue was calculated for a new CT plant economically dispatched by PJM. It was assumed that the CT plant had a minimum run time of two hours. The unit was first committed day ahead in profitable blocks of at least two hours, including start costs. If the unit was not already committed day ahead, it was run in real time in standalone profitable blocks of at least two hours, or any additional profitable hours bordering the profitable day-ahead or real-time block.

The new entrant CT is larger and more efficient than most CTs currently operating in PJM. The new entrant CT energy market net revenue results must therefore be interpreted carefully when comparing to existing CTs which are generally smaller and less efficient than the newest CT technology used by the new entrant CT.

New entrant CT plant energy market net revenues were higher in all zones except DUQ in the first three months of 2025 as a result of the relative changes in energy and gas prices (Table 7-5).

**Table 7-5 Energy net revenue for a new entrant gas fired CT under economic dispatch: January through March, 2014 through 2025 (Dollars per installed MW-year)<sup>15</sup>**

<sup>15</sup> The energy net revenues presented for the PJM area in this section are calculated using the zonal average LMP.

## New Entrant Combined Cycle

Energy market net revenue was calculated for a new CC plant economically dispatched by PJM. It was assumed that the CC plant had a minimum run time of four hours. The unit was first committed day ahead in profitable blocks of at least four hours, including start costs.<sup>16</sup> The unit was allowed to extend its run in real time if it was profitable to do so.

New entrant CC plant energy market net revenues were higher in all zones in the first three months of 2025 as a result of the relative changes in energy and gas prices (Table 7-6).

**Table 7-6 Energy net revenue for a new entrant CC under economic dispatch: January through March, 2014 through 2025 (Dollars per installed MW-year)<sup>17</sup>**

<sup>16</sup> All starts associated with combined cycle units are assumed to be warm starts.

<sup>17</sup> The energy net revenues presented for the PJM area in this section represent the zonal average energy net revenues.

## New Entrant Coal Plant

Energy market net revenue was calculated for a new CP plant economically dispatched by PJM. It was assumed that the CP plant had a minimum run time of eight hours. The unit was first committed day ahead in profitable blocks of at least eight hours, including start costs. The unit was allowed to extend its run in real time if it was profitable to do so.

New entrant CP plant energy market net revenues were higher in all zones in the first three months of 2025 as a result of higher dark spreads (Table 7-7).

**Table 7-7 Energy net revenue for a new entrant CP: 2014 through January through March, 2025 (Dollars per installed MW-year)<sup>18</sup>**

## New Entrant Nuclear Plant

Energy market net revenue was calculated assuming that the nuclear plant was dispatched day ahead by PJM for all available plant hours. The unit runs for all hours and output reflects the class average equivalent availability factor.<sup>19</sup>

New entrant nuclear plant energy market net revenues were higher in all zones in the first three months of 2025 as a result of higher energy prices (Table 7-8).

**Table 7-8 Energy net revenue for a new entrant nuclear plant: January through March, 2014 through 2025 (Dollars per installed MW-year)<sup>20</sup>**

<sup>19</sup> The annual class average equivalent availability factor was used in the calculation of energy market net revenues.

<sup>20</sup> The energy net revenues presented for the PJM area in this section represent the zonal average energy net revenues because fuel costs for nuclear units are included in the NEI nuclear costs.

## New Entrant Diesel

Energy market net revenue was calculated for a DS plant economically dispatched by PJM in real time.

New entrant DS plant energy market net revenues were higher in all zones in the first three months of 2025 as a result of higher and more volatile energy prices (Table 7-9).

**Table 7-9 Energy market net revenue for a new entrant DS: January through March, 2014 through 2025 (Dollars per installed MW-year)**

## New Entrant Onshore Wind Installation

Energy market net revenues for an onshore wind installation were calculated hourly by zone assuming the unit generated at the average hourly capacity factor of all operating wind units in the zone with an installed capacity greater than 3 MW.<sup>21</sup>

Onshore wind energy market net revenues in the defined zones were higher in the first three months of 2025 as a result of changes in energy prices.

**Table 7-10 Energy market net revenue for an onshore wind installation (Dollars per installed MW-year): January through March, 2014 through 2025**

Zone	Jan-Mar												Change in 2025 from 2024
	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	
AEP	\$45,406	\$26,566	\$21,777	\$22,697	\$38,566	\$23,727	\$13,525	\$18,024	\$35,754	\$23,155	\$22,084	\$39,107	77%
APS	\$53,819	\$33,489	\$19,391	\$24,579	\$39,477	\$19,314	\$13,487	\$17,251	\$33,236	\$23,017	\$21,296	\$43,231	103%
COMED	\$39,397	\$23,379	\$16,746	\$21,821	\$24,103	\$20,127	\$11,754	\$18,216	\$27,570	\$19,795	\$17,750	\$24,848	40%

## New Entrant Offshore Wind Installation

Energy market net revenues for an offshore wind installation were calculated hourly for relevant zones assuming the unit generated at a 40 percent capacity factor.

Offshore wind energy market net revenues were higher in the first three months of 2025 as a result of higher energy prices.

**Table 7-12 Energy market net revenue for an offshore wind installation (Dollars per installed MW-year): 2014 through 2025, January through March**

Jan-Mar													Change in 2025 from 2024
Zone	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	
ACEC	\$85,651	\$48,092	\$21,071	\$24,600	\$40,720	\$26,205	\$16,368	\$22,664	\$47,210	\$22,908	\$23,108	\$39,968	73%

<sup>24</sup> Net revenues are calculated for zones in which there are sufficient operating units to determine capacity factor for a new entrant unit.

<sup>25</sup> RECs prices obtained from Evolution Markets, Inc.

## Historical New Entrant CC Revenue Adequacy

Total unit net revenues include energy and capacity market revenues. Analysis of the total unit revenues of theoretical new entrant CCs for three representative locations shows that CC units that entered the PJM markets in 2007 have covered 89 percent of their total costs in the BGE Zone and 81 percent of total costs in the PSEG Zone, and 49 percent of total costs in the COMED Zone, including the return on and of capital, on a cumulative basis. The analysis also shows that theoretical new entrant CCs that entered the PJM markets in 2012 have covered over 100 percent of their total costs on a cumulative basis in the BGE Zone, 92 percent of their total costs in PSEG Zone, and 61 percent of total costs in the COMED Zone. Energy market revenues alone were not sufficient to cover total costs in any scenario, which demonstrates the critical role of the capacity market revenue in covering total costs. Covering 100 percent of total costs in this analysis includes earning the assumed rate of return. Units earned a positive rate of return even when earning less than the assumed rate of return.

Under cost of service regulation, units are guaranteed that they will cover their total costs, assuming that the costs were determined to be reasonable. To the extent that units built in the PJM markets did not cover their total costs, investors were worse off and customers were better off than under cost of service regulation, ignoring the benefits of competition on increasing efficiency, reducing costs and improving technology and ignoring the possibility of over earning under cost of service regulation.

Figure 7-59 compares cumulative energy market net revenues and energy market net revenues plus capacity market revenues to cumulative levelized costs for a new entrant CC that began operation on January 1, 2007, and a new entrant CC that began operation on January 1, 2012. The solid black line shows the total net revenue required to cover total costs. The solid colored lines show net energy revenue by zone. The dashed colored lines show the sum of net energy and capacity revenue by zone.

Figure 7-5 Historical new entrant CC revenue adequacy: 2007 through March 2025 and 2012 through March 2025<sup>26</sup>

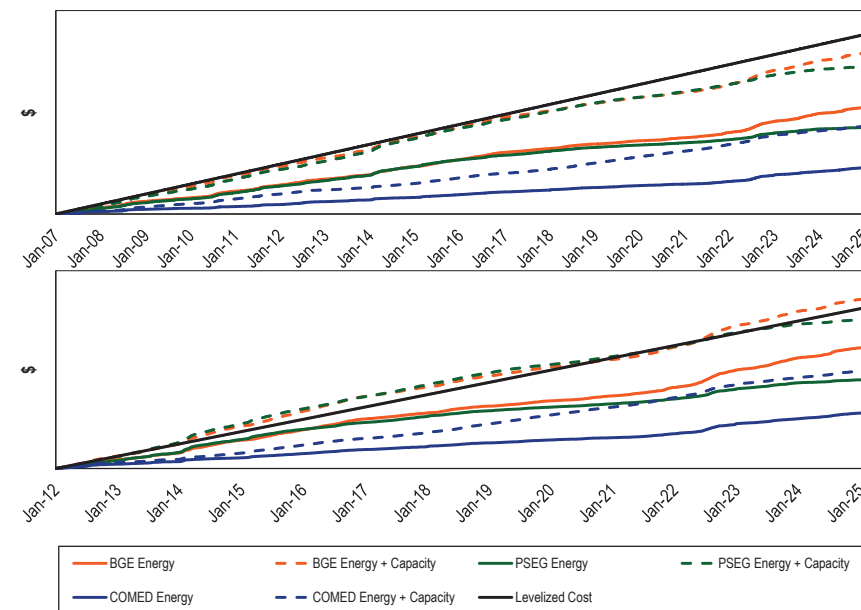

Table 7-16 shows the percent of levelized total costs recovered from the start date through 2023. Table 7-16 also shows the return (IRR) earned from the start date through June 2024. For example, for a CC built in BGE in 2012, the resource would have earned a 14 percent IRR compared to the required 12 percent. In contrast, for a CC built in ComEd in 2012, the resource would have earned a 2 percent IRR compared to the required 12 percent.

<sup>26</sup> The gas pipeline pricing points used in this analysis are Zone 6 non-NY for BGE, Chicago City Gate for COMED, and Texas Eastern M3 for PSEG.

**Table 7-16 Percent of levelized total costs recovered**

	2007 CC	2012 CC
Percent of levelized costs covered at 12% IRR		
BGE	89%	105%
COMED	49%	61%
PSEG	81%	92%
IRR at which levelized costs are covered		
BGE	9%	14%
COMED	0%	2%
PSEG	7%	11%

The assumptions used for this analysis are shown in Table 7-17.

**Table 7-17 Assumptions for analysis of new entry in 2007 and 2012**

	2007 CC	2012 CC

## Nuclear Net Revenue Analysis

The analysis of nuclear plants includes annual avoidable costs and incremental capital expenditures from the Nuclear Energy Institute (NEI) based on NEI's calculations of average costs for all U.S. nuclear plants.<sup>27 28</sup> The analysis includes the most recent operating cost data and incremental capital expenditure data for single unit plants and multi unit plants published by NEI, which is for

<sup>27</sup> Operating costs from: Nuclear Energy Institute (February 2025). "Nuclear Costs in Context," <<https://www.nei.org/resources/reports-briefs/nuclear-costs-in-context>>. Individual plants may vary from the average due to factors such as geographic location, local labor costs, the timing of refueling outages and other unit specific factors. This is the most current NEI data available.

<sup>28</sup> The NEI costs for Hope Creek were treated as that of a two unit configuration because the unit is located in the same area as Salem 1 & 2. The net surplus of Hope Creek is sensitive to the accuracy of this assumption.

2023.<sup>29</sup> NEI average operating costs have decreased since their peak in 2012 (a 7.5 percent decrease from 2012 through 2023 for all plants including single and multiple unit plants in nominal dollars; a 33.0 percent decrease in real 2023 dollars).<sup>30</sup> NEI average incremental capital expenditures have decreased since their peak in 2012 (a 32.8 percent decrease from 2012 through 2023 for all plants including single and multiple unit plants in nominal dollars; a 51.1 percent decrease in real 2023 dollars).<sup>31</sup> NEI's incremental capital expenditures peaked in 2012 as a result of regulatory requirements following the 2011 accident at the Fukushima nuclear plant in Japan.

The results for nuclear plants are sensitive to small changes in PJM energy and capacity prices, both actual and forward prices.<sup>32</sup> When gas prices are high and LMPs are high as a result, net revenues to nuclear plants increase. In 2014, the polar vortex resulted in a significant increase in net revenues to nuclear plants. When gas prices are low and LMPs are low as a result, net revenues to nuclear plants decrease. In 2016, PJM energy prices were then at the lowest level since the introduction of competitive markets on April 1, 1999, and remained low in 2017. As a result, in 2016 and 2017, a significant proportion of nuclear plants did not cover annual avoidable costs based on current year prices.<sup>33</sup> In 2018, high gas prices and high LMPs resulted in a significant increase in net revenues for nuclear plants in PJM. Energy prices in 2018 were significantly higher than in 2017. Although energy prices in 2019 were lower than in 2016, higher capacity market revenues more than offset the difference. In 2020, PJM energy prices were at the lowest level since the introduction of competitive markets, even lower than in 2016. Average energy prices in 2022 were higher than energy prices in any year since the inception of PJM markets in 1999. Based on forward prices as of March 31,

<sup>29</sup> NEI also provides average costs by plant run by operators with one plant or multiple plants, by market, and by type of nuclear reactor. Plants run by operators with multiple plants have lower average costs than plants run by operators with a single plant. Plants participating in wholesale markets have lower average costs than plants in regulated markets. PWR reactors have lower average generating costs than BWR reactors.

<sup>30</sup> Operating costs in this paragraph are operating costs as specified by NEI and do not include fuel costs or capital expenditures. Operating costs for single unit plants decreased by 2.6 percent from 2022 to 2023 in nominal dollars. Operating costs for multiple unit plants increased by 6.0 percent from 2022 to 2023 in nominal dollars.

<sup>31</sup> Capital expenditures have decreased 20.6 percent since 2012 for single unit plants and 35.0 percent for multiple unit plants in nominal dollars.

<sup>32</sup> A change in the capacity market price of \$24 per MW-day translates into a change in capacity revenue of \$1.00 per MWh for a nuclear power plant operating at a capacity factor of 100 percent. A change in the capacity market price of \$24 per MW-day translates into a change in capacity revenue of \$1.05 per MWh for a nuclear power plant operating at a capacity factor of 0.951 percent.

<sup>33</sup> The MMU submitted testimony in New Jersey on the same issues of nuclear economics. *Establishing Nuclear Diversity Certificate Program*. Bill No. S-877 New Jersey Senate Environment and Energy Committee. (2018). *Revised Statement of Joseph Bowring*.

2025, expected nuclear plant energy revenues for 2025 and 2026 are higher than actual revenues in all years since 2014, with the exception of 2022. The actual net revenue results for individual nuclear plants are a function of the degree to which actual unit costs are less than or greater than the benchmark NEI data.

Table 7-18 shows energy market prices, Table 7-19 and Table 7-20 show capacity market prices and Table 7-21 shows nuclear cost data for the 16 nuclear plants in PJM in addition to Oyster Creek, which retired September 17, 2018, and Three Mile Island, which retired September 20, 2019.<sup>34</sup> The analysis excludes the Catawba 1 nuclear unit. Partial data is provided for the Cook, North Anna, and Surry nuclear units. The AEP Cook nuclear units are designated FRR. North Anna 1 and 2 and Surry 1 and 2 are part of the Dominion FRR for the 2022/2023 and 2023/2024 and 2024/2025 Delivery Years.<sup>35 36 37</sup> FRR units receive cost of service revenues and are not subject to PJM market revenues. Duke's Catawba 1 is not in PJM but is pseudo tied to PJM.

For nuclear plants, all calculations are based on publicly available data in order to avoid revealing confidential information. Historical nuclear unit revenue is based on day-ahead LMP at the relevant node. Nuclear unit capacity revenue assumes that the unit cleared its full unforced capacity at the BRA locational clearing price. Unforced capacity is determined using the annual class average EFORD rate.

**Table 7-18 Nuclear unit day-ahead LMP: 2008 through 2024**

Hope Creek, Quad Cities, and Salem have all received state subsidies since 2019.<sup>44 45</sup> The NJ Board of Public Utilities, having received no applications as of December 1, 2023, closed the third eligibility period of the ZEC program for the period beginning June 1, 2025.<sup>46</sup> This was a result of the introduction of a new federal nuclear subsidy under the Inflation Reduction Act. Braidwood, Byron, Dresden, and LaSalle will receive a state subsidy if necessary to meet a target net revenue value, in dollars per MWh, from the energy and capacity markets.<sup>47</sup> All existing nuclear plants will receive a federal subsidy if necessary to meet a target revenue value, in dollars per MWh, from the energy market.<sup>48</sup>

The Inflation Reduction Act added a significant new federal subsidy for existing nuclear power plants.<sup>49</sup> All existing nuclear plants will receive the Zero Emission Nuclear Power Production Credit (Nuclear PTC) if revenues from energy, ancillary, capacity markets, and any state subsidies are between \$25.00/MWh and \$43.75/MWh, adjusted for inflation. The Nuclear PTC of \$3.00/MWh is increased by a factor of five to \$15.00/MWh if certain prevailing wage requirements are met. The Nuclear PTC creates a revenue floor of \$40.00/MWh and does not create a revenue ceiling. If nuclear revenues are greater than \$43.75/MWh, the Nuclear PTC subsidy does not apply and units keep all profits.

Three Mile Island	-	-	-	-	-	-	-

Table 7-23 shows the surplus or shortfall in \$/MWh for the 16 nuclear plants in PJM, and Oyster Creek and Three Mile Island, calculated using historic LMP and cost data. In 2020, no nuclear plants covered their fuel costs, operating costs, and incremental capital expenditures as a result of lower energy prices. In 2021 and 2022, all nuclear plants more than covered their fuel costs, operating costs, and capital expenditures as a result of higher energy prices. In 2023, only two nuclear plants covered their fuel costs, operating costs, and incremental capital expenditures as a result of lower energy and capacity prices. In 2024, all nuclear plants with the exception of Davis Besse covered their fuel costs, operating costs, and incremental capital expenditures. The surplus or shortfall assumes that the unit receives the DA LMP, reactive capability revenue, cleared its full unforced capacity at the BRA locational clearing price, receives a subsidy if qualified, and has costs equal to the

NEI average costs.<sup>50</sup> Unforced capacity is determined using the annual class average EFORD rate.

The market revenues are based in part on the sale of capacity. Some nuclear plants did not clear the capacity market in some years as a result of decisions by plant owners about how to offer the plants in the capacity market auctions. When nuclear plants do not clear in the capacity market, it is a result of the offer behavior of the plants and does not accurately reflect the economic viability of the plants. This analysis is intended to define whether the plants are receiving a retirement signal from the PJM markets. If the plants are viable including both energy and capacity market revenues based on actual clearing prices, then the PJM markets indicate that the plant is economically viable. If plant owners decide to offer so as to not clear in the capacity market, that does not change the market signals to the plants. Such decisions may reflect a variety of considerations. Quad Cities and a portion of Byron's capacity did not clear in the 2019/2020 Auction.<sup>51</sup> Quad Cities did not clear in the 2020/2021 Auction.<sup>52</sup> Dresden and most of Byron did not clear in the 2021/2022 Auction.<sup>53</sup> Beaver Valley, Davis Besse, and Perry did not clear in the 2021/2022 Auction.<sup>54</sup> Byron, Dresden, and Quad Cities did not clear in the 2022/2023 Auction.<sup>55</sup>

Nuclear unit revenue is a combination of energy market revenue, ancillary services market revenue and capacity market revenue. Negative energy market prices do not have a significant impact on nuclear unit revenue. Since 2014, negative energy market prices have affected nuclear plants' annual total revenues by an average of 0.1 percent. Negative LMPs reduced nuclear plant total revenues by an average of 0.0 percent and a maximum of 0.6 percent in 2014, an average of 0.2 percent and a maximum of 1.2 percent in 2015, an average of 0.1 percent and a maximum of 0.7 percent in 2016, an average of

In order to evaluate the expected viability of nuclear plants, analysis was performed based on forward energy market prices for 2025, 2026, and 2027 and known capacity market prices for 2024 and 2025. The purpose of the forward analysis is to evaluate whether current forward prices are consistent with nuclear plants covering their annual avoidable costs over the next three years. While the forward capacity market prices are known through the 2025/2026 Delivery Year, actual energy prices will vary from forward values. Nuclear plants may choose to sell their output at a range of forward prices and for a range of future years.

Table 7-25 shows PJM energy prices (LMP), annual fuel, and operating and capital expenditures used for the analysis of the period 2025 through 2027. Capacity revenues for calendar year 2026 include five months of capacity revenue from the 2025/2026 delivery year and seven months of capacity revenue assuming a clearing price of \$325/MW-Day for the 2026/2027 delivery year.<sup>57</sup> The 2026/2027 BRA and 2027/2028 BRA have not yet been run. The LMPs are based on forward prices with a basis adjustment for the specific plant locations.<sup>58</sup> Forward prices are as of March 31, 2025. The capacity prices are known through 2025 based on PJM capacity auction results.

<sup>57</sup> On February 20, 2025, PJM filed with FERC to establish a maximum price of approximately \$325/MW-day in unforced capacity and a minimum price of approximately \$175/MW-day, both in unforced capacity (UCAP) terms for all capacity auctions for the 2026/2027 and 2027/2028 Delivery Years. See Docket No. ER25-1357.

<sup>58</sup> Forward prices on March 31, 2025. Forward prices are reported for PJM trading hubs which are adjusted to reflect the historical differences between prices at the trading hub and prices at the relevant plant locations. The basis adjustment is based on 2024 data.

**Table 7-25 Forward prices in PJM energy markets, capacity revenue, and annual costs**

The MMU also calculates the capacity price that would be required to cover the net avoidable costs for each nuclear plant.

Based on the FERC order allowing the inclusion of major maintenance in energy offers, major maintenance costs can no longer be included in gross ACR values offered in the capacity market.<sup>59</sup> The MMU calculates the capacity price that would be required to cover the net avoidable costs for each nuclear plant with major maintenance included in avoidable costs and with major maintenance excluded from avoidable costs. For the case including major maintenance, gross ACR is NEI total cost including fuel, operating cost, and incremental capital expenditures. For the case excluding major maintenance, gross ACR is NEI total cost including fuel and operating cost, excluding capital expenditures as a proxy for fixed VOM, given that NEI does not provide a breakout of major maintenance. NEI incremental capital expenditures are likely to be a conservatively low estimate of major maintenance expense.

59 See 167 FERC ¶ 61,030 at P 41 (2019).

All generating plants including nuclear plants must cover their gross avoidable costs, including major maintenance, to remain economically viable. All of the MMU analysis of nuclear plant economics includes gross avoidable costs as reported by NEI unless explicitly stated otherwise.

In Table 7-26, the capacity price required to cover avoidable costs in \$/MWh is calculated by taking the total NEI costs in \$/MWh and subtracting the total expected energy and ancillary services revenues in \$/MWh. Total expected energy revenue is the unit's ICAP multiplied by the average forward LMP multiplied by the class average capacity factor. Total expected ancillary services revenue is unit specific reactive capability revenue.<sup>60</sup> The capacity price required to cover avoidable costs in \$/MW-day is calculated by multiplying the required price in \$/MWh by 24. Plants

may have actual operating costs higher or lower than the NEI average.

In Table 7-26, the capacity price required to cover avoidable costs is \$0/MW-day for all units in 2025, 2026 and 2027 using NEI data as reported including capital expenditures, and is \$0/MW-day for all plants, excluding capital expenditures as a proxy for major maintenance, in 2025, 2026, and 2027.<sup>61</sup> Net revenues based on forward energy prices alone are greater than or equal to avoidable costs in 2025, 2026, and 2027 without any contribution from capacity market revenues for all plants. The result is that net ACR values for 2025, 2026 and 2027 in Table 7-26 are zero.

60 Reactive Supply & Voltage Control Revenue Requirements available from PJM <<https://www.pjm.com/markets-and-operations/billing-settlements-and-credit.aspx>>.

61 PJM's tariff definition of avoidable costs excludes major maintenance. PJM includes major maintenance costs in the definition of short run marginal costs in energy offers.

Table 7-27 shows the surplus or shortfall that would be received net of avoidable costs and incremental capital expenditures by year, based on forward prices, on a per MWh basis. The fuel and operating costs are the 2023 NEI fuel, operating, and capital costs. Plants may have operating costs higher or lower than the NEI average. Table 7-27 shows the total dollar surplus or shortfall and adjusts energy revenues and operating costs using the annual class average capacity factor.

The 2025 nuclear unit surplus values are shown in Table 7-27 based on forward prices as of March 31, 2025, NEI average costs, and expected subsidy values.<sup>62</sup> The current analysis, based on forward prices for energy, known forward prices for capacity, and an assumed clearing price of \$325/MW-Day for the 2026/2027 delivery year, shows that all PJM nuclear plants analyzed are expected to have a surplus without any subsidy amount in 2025 and 2026.<sup>63</sup>

<sup>62</sup> Gross receipts used to calculate the unit subsidy include energy revenue, ancillary services revenue, capacity revenue, and state ZECs subsidies, and assumes the unit meets prevailing wage requirements and receives the Zero Emission Nuclear Power Production Credit 5 times multiplier. Effectively, nuclear power plants will receive the higher of the state or federal subsidy amount.

<sup>63</sup> On February 20, 2025, PJM filed with FERC to establish a maximum price of approximately \$325/MW-day in unforced capacity and a minimum price of approximately \$175/MW-day, both in unforced capacity (UCAP) terms for all capacity auctions for the 2026/2027 and 2027/2028 Delivery Years. See Docket No. ER25-1357.

64 The state subsidy value for Braidwood, Byron, Dresden, and LaSalle is calculated by taking the applicable Baseline Cost less forward energy prices and known capacity prices.

65 The federal subsidy value for nuclear plants is defined in the Inflation Reduction Act of 2022, Public Law 117-169 (August 16, 2022).

66 North Anna and Surry are in Dominion FRR beginning with the 2022/2023 Delivery Year. North Anna and Surry rejoined the PJM Capacity Market beginning with the 2025/2026 Delivery Year.
