Planning for Large Load Additions

- **IMM made presentation to PC on January 5, 2025 on planning for large load additions.**
- **Goal is to start discussion about how to develop approach to planning issues associated with large load additions.**

Planning for Large Load Additions

- **The addition of significant new loads should go through a complete PJM analysis and planning process that includes addressing system reliability and is not narrowly limited to local transmission issues or broader transmission issues alone, even if that process is time consuming.**
- **Every new generator and every large load addition should go through this process. PJM is a complex, interactive system. There are no short cuts.**
 - **You are either on the grid or off the grid.**

Planning for Large Load Additions

- **PJM planning should be comprehensive and include the addition or retirement of transmission, generation and load.**
- **PJM should do comprehensive planning and explicitly plan for large load additions in the same way that PJM plans for new generation and new transmission.**
- **There should be an orderly queue, including milestones to verify additions, and large loads should not be added until they can be reliably served without disrupting markets for other customers.**

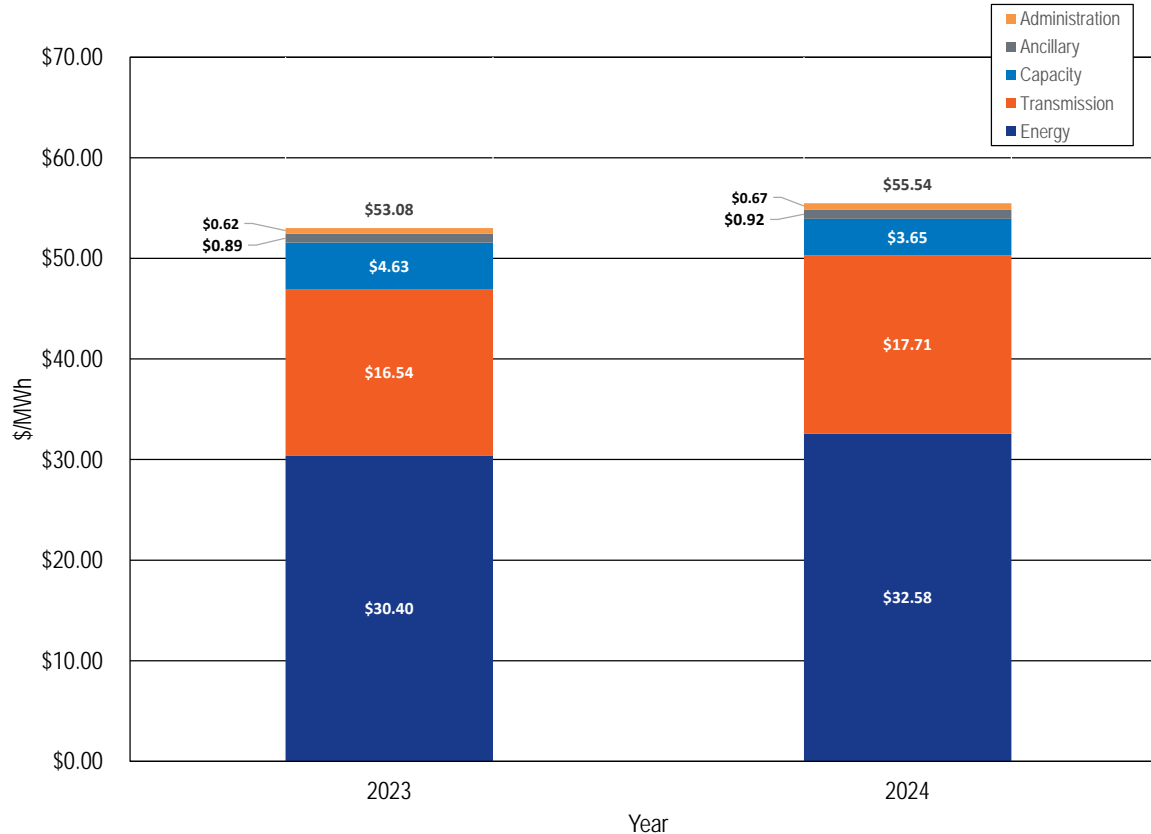

Large Load Issues

- **PJM planning (all of PJM and not only the Planning Department) needs to address comprehensive planning of generation, transmission and load.**
- **PJM markets address new generation.**
- **PJM transmission planning addresses new transmission.**
- **Transmission owners address local issues through necessary studies and supplemental projects.**
- **EDCs address requests to interconnect.**
- **The issue is that PJM does not address all three elements of comprehensive planning.**

Large Load Issues

- **Planning process/queue required for large load additions regardless of financial arrangements.**
 - **PPAs do not solve the issues**
 - **ISAs do not solve the issues**
- **Large load additions cannot be addressed via private bilateral agreements.**
- **Planning process/queue needs to account for locational issues associated with large load additions.**
 - **Local balance of generation and load**
 - **Location of new generation with new load**

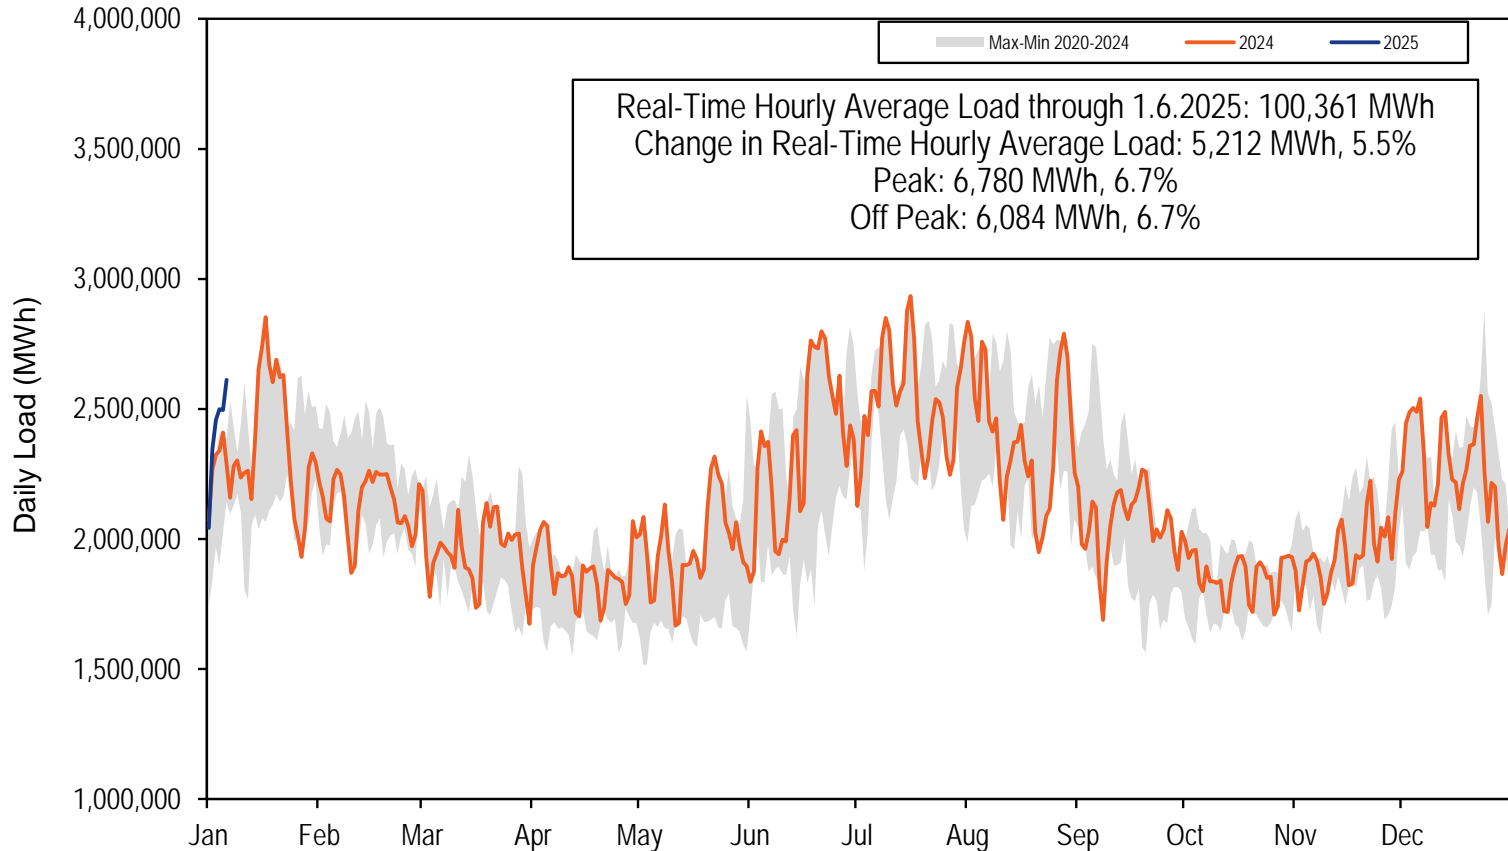

Total Cost of Wholesale Power

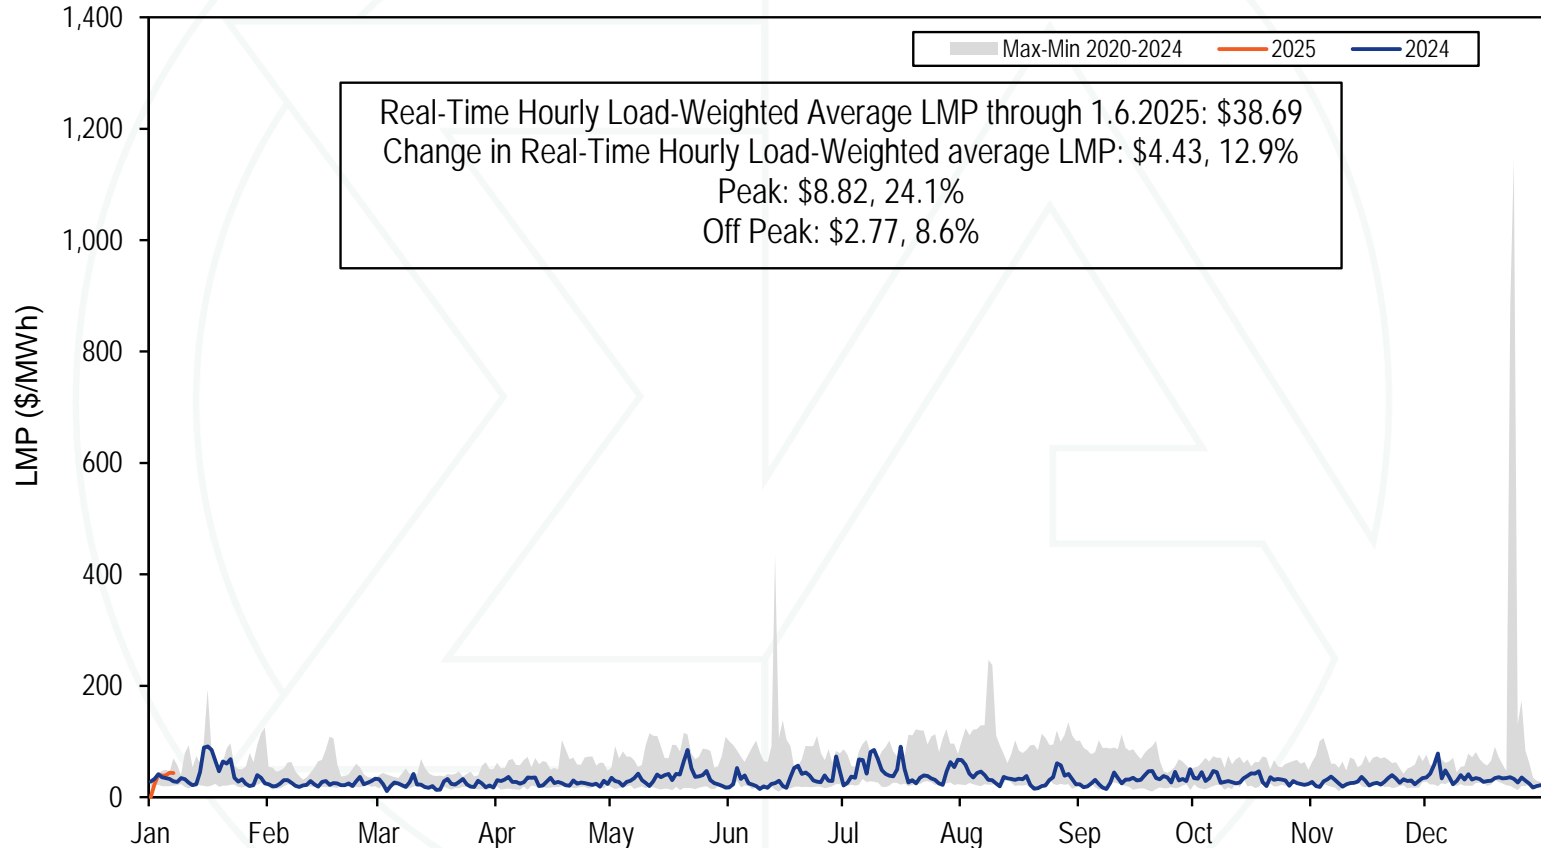

Total Cost of Wholesale Power

2024	8,532	2,901	51.5%	8.2%	9,768	(226)	(2.3%)	10.3%

Fast Start Pricing: DLMP and PLMP

- **PJM implemented fast start pricing in both the day-ahead and real-time markets on September 1, 2021.**
- **The goal of fast start pricing is to allow inflexible resources to set prices based on the sum of their commitment costs per MWh and their marginal costs.**
- **The pricing run LMP (PLMP) is now the official settlement LMP in PJM, replacing the dispatch run LMP (DLMP)**

Fast Start Pricing: DLMP and PLMP

- **Fast start pricing employs a new LMP calculation called the pricing run.**
- **The pricing run calculates LMP using the same optimal power flow algorithm as the dispatch run while simultaneously reducing (“relaxing” or ignoring) the economic minimum and maximum output MW constraints for all eligible fast start units.**

Fast Start Pricing: DLMP and PLMP

- **The price signal no longer equals the short run marginal cost and therefore no longer provides the correct signal for efficient behavior for market participants making decisions on the margin.**
- **The differences between the actual LMP (DLMP) and the fast start LMP (PLMP) distort the incentive for market participants to behave competitively and to follow PJM's dispatch instructions.**

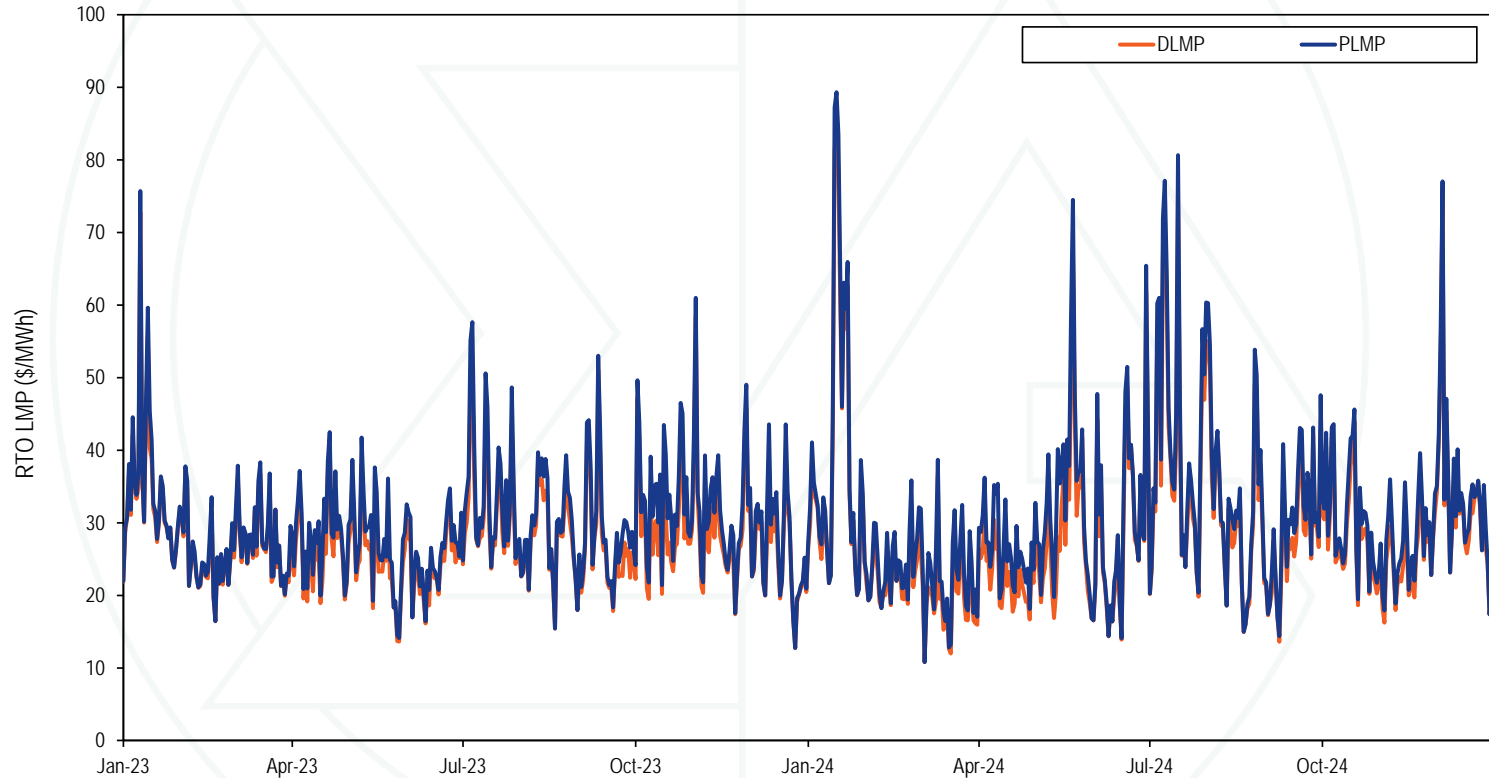

Fast Start Pricing: DLMP and PLMP

- **PJM also uses the pricing run for capping the system marginal price at \$3,700 per MWh.**
 - **This was last used during Winter Storm Elliott.**
 - **The cap applies to the marginal energy component of LMP, but the congestion and loss components of LMP can exceed the cap.**
- **PJM uses a lower default transmission constraint penalty factor in the pricing run in the day-ahead market.**
 - **\$30,000 per MWh in the dispatch run**
 - **\$2,000 per MWh in the pricing run**
